WHO DO YOU CALL WHEN YOUR DEBUGGER WON'T DEBUG?

The problem with most real-time operating systems is simple, they're not an integrated solution. You end up dealing with a multitude of suppliers for languages, compilers, debuggers and other important development tools. And when something does go wrong, it can be a frustrating experience trying to straighten out the mess.

Why Not Try the Microware One-Stop Total Solution?

Microware's OS-9 Real-Time Operating System is a total integrated software system, not just a kernel. We offer an extensive set of development tools, languages, I/O and Kernel options. ***And this total integrated solution is entirely designed, built and supported by the same expert Microware team.***

Microware is a registered trademark of Microware Systems Corporation.
OS-9 is a trademark of Microware.
UNIX is a trademark of AT&T.
VAX is a trademark of DEC.

Modularity Lets YOU Choose Just What You Need.

The modular design of OS-9 allows our Operating System to adapt as your requirements change. OS-9 can support a complete spectrum of applications — from embedded ROM-based code in board-level products all the way up to large-scale systems.

Support is Part of the Package.

Microware is proudly setting the industry's standard for customer support. You'll find professional and comprehensive technical documentation and a Customer Hotline staffed by courteous and authoritative software engineers.

So stop messing with simple kernels and independent suppliers. Call Microware today and find out more about the "One-Stop Integrated Solution" with OS-9!

The OS-9 Success Kit

A Total Integrated Solution for Your Next Project

Development Tools:

C Source Level Debugger
Symbolic Debugger
System State Debugger
uMACS Text Editor
Electronic Mail
Communications
Super Shell

Kernel Options:

MMU (Security Protection) Support
Math Coprocessor Support

Mustang Specifications

12.5 Mhz (optional 16.6 Mhz available) MC68020 full 32-bit wide path
32-bit wide data and address buses, non-multiplexed
on chip instruction cache
object code compatible with all 68XXX family processors
enhanced instruction set - math co-processor interface
68881 math hi-speed floating point co-processor (optional)
direct extension of full 68020 instruction set
full support IEEE P754, draft 10-0
transcendental and other scientific math functions
2 Megabyte of SIP RAM (512 x 32 bit organization)
up to 256K bytes of EPROM (64 x 32 bits)
4 Asynchronous serial I/O ports standard
optional 20 serial ports
standard RS-232 interface
optional network interface
buffered 8 bit parallel port (1/2 MC68230)
Centronics type pinout
expansion connector for I/O devices
16 bit data path
256 byte address space
2 interrupt inputs
clock and control signals
Motorola I/O Channel Modules
time of day clock/calendar w/battery backup
controller for 2.5 1/4" floppy disk drives
single or double side, single or double density
35 to 80 track selectable (48-96 TPI)
SASI interface
programmable periodic interrupt generator
interrupt rate from micro-seconds to seconds
highly accurate time base (5 PPM)
5 bit sense switch, readable by the CPU
Hardware single-step capability

Don't be misled!
ONLY Data-Comp
delivers the Super
MUSTANG-020

These hi-speed 68020 systems are presently working at NASA, Atomic Energy Commission, Government Agencies as well as Universities, Business, Labs, and other Critical Applications Centers, worldwide, where speed, math crunching and multi-user, multi-tasking UNIX C level V compatibility and low cost is a must.

Only the "PRO" Version
of OS-9 Supported!

This is HEAVY DUTY
Country!

For a limited time we will offer a \$400 trade-in on your old 68XXX SBC. Must be working properly and complete with all software, cables and documentation. Call for more information

68 Micro Journal is the *original* "DeskTop Publishing" product and has continuously published since 1978 using only micro-computers and special "DeskTop" software. Using first a kit built 6800 micro-computer, a modified "ball" typewriter, and "home grown" DeskTop Publishing software. None was commercially available at that time. For over 10 years we have been doing "DeskTop Publishing"! We originated what has become traditional "DeskTop Publishing"! Today 68 Micro Journal is acknowledged as the "Grandfather" of "DeskTop Publishing" technology.

68 Micro Journal (ISSN 0194-5025) is published 12 times a year by Computer Publishing Inc. Second Class Postage paid at Hixson, TN. and additional entries. POSTMASTER: send address changes to 68 Micro Journal, POB 849, Hixson, TN 37343.

Subscription Rates

1 Year \$24.50 USA, Canada & Mexico \$34.00 a year.
Others add \$12.00 a year surface, \$48.00 a year Airmail, USA funds. 2 years \$42.50, 3 years \$64.50 plus additional postage for each additional year.

Items or Articles for Publication

Articles submitted for publication must include authors name, address, telephone number, date and a statement that the material is original and the property of the author. Articles submitted should be on diskette, OS-9, SK-DOS, FLEX, Macintosh or MS-DOS. All printed items should be dark type and satisfactory for photo-reproduction. No blue ink! No hand written articles - please! Diagrams o.k.

Please - do not format with spaces any text indents, chapters, etc. (source listing o.k.). We will edit in all formatting. Text should be flush left and use a carriage return only to indicate a paragraph end. Please write for free authors guide.

Letters & Advertising Copy

Letters to the Editor should be the original copy, signed! Letters of grip as well as praise are acceptable. We reserve the right to reject any letter or advertising material, for any reason we deem advisable. Advertising Rates: Commercial please contact 68 Micro Journal Advertising Department. Classified advertising must be non-commercial. Minimum of \$15.50 for first 15 words. Add \$.60 per word thereafter. No classifieds accepted by telephone.

SCULPTOR

Full OEM & Dealer Discounts Available!

THE SCULPTOR SYSTEM

Sculptor combines a powerful fourth generation language with an efficient database management system. Programmers currently using traditional languages such as Basic and Cobol will be amazed at what Sculptor does to their productivity. With Sculptor you'll find that what used to take a week can be achieved in just a few hours.

AN ESTABLISHED LEADER

Sculptor was developed by professionals who needed a software development tool with capabilities that were not available in the software market. It was launched in 1981 and since then, with feedback from an ever-increasing customer base, Sculptor has been refined and enhanced to become one of the most adaptable, fast, and above all reliable systems on the market today.

SYSTEM INDEPENDENCE

Sculptor is available on many different machines and for most operating systems, including MS-DOS, Unix/Xenix and VMS. The extensive list of supported hardware ranges from small personal computers, through multi-user micros up to large minis and mainframes. Sculptor is constantly being ported to new systems.

APPLICATION PORTABILITY

Mobility of software between different environments is one of Sculptor's major advantages. You can develop applications on a stand alone PC and - without any alterations to the programs - run them on a large multi-user system. For software writers this means that their products can reach a wider marketplace than ever before. It is this system portability, together with high-speed development, that makes Sculptor so appealing to value added resellers, hardware manufacturers and software developers of all kinds.

SPEED AND EFFICIENCY

Sculptor uses a fast and proven indexing technique which provides instant retrieval of data from even the largest of files. Sculptor's fourth generation language is compiled to a compact intermediate code which executes with impressive speed.

INTERNATIONALLY ACCEPTED

By using a simple configuration utility, Sculptor can present information in the language and format that you require. This makes it an ideal product for software development almost anywhere in the world. Australia, the Americas and Europe - Sculptor is already at work in over 20 countries.

THE PACKAGE

With every development system you receive:

- ☐ A manual that makes sense
- ☐ A periodic newsletter
- ☐ Screen form language
- ☐ Report generator
- ☐ Menu system
- ☐ Query facility
- ☐ Set of utility programs
- ☐ Sample programs

For resale products, the run-time system is available at a nominal cost.

Facts

Features

DATA DICTIONARY

Each file may have one or more record types described. Fields may have a name, heading, type, size, format and validation list. Field type may be chosen from:

- ☐ alphanumeric
- ☐ integer
- ☐ floating point
- ☐ money
- ☐ date

DATA FILE STRUCTURE

- ☐ Packed, fixed-length records
- ☐ Money stored in lower currency unit
- ☐ Dates stored as integer day numbers

INDEXING TECHNIQUE

Sculptor maintains a B-tree index for each data file. Program logic allows any numbers of alternative indexes to be coded into one other file.

INPUT DATA VALIDATION

Input data may be validated at three levels:

- ☐ automatic by field type
- ☐ validation list in data dictionary
- ☐ programmer coded logic

ARITHMETIC OPERATORS

- Unary minus
- * Multiplication
- / Division
- % Remainder
- + Addition
- Subtraction

RELATIONAL OPERATORS

- = Equal to
- < Less than
- > Greater than
- <= Less than or equal to
- >= Greater than or equal to
- <> Not equal to
- and Logical and
- or Logical or
- ct Contains
- bw Begins with

SPECIAL FEATURES

- ☐ Full date arithmetic
- ☐ Echo suppression for passwords
- ☐ Terminal and printer independence
- ☐ Parameter passing to sub-programs
- ☐ User definable date format

MAXIMA AND MINIMA

- Minimum key length 1 byte
- Maximum key length 160 bytes
- Minimum record length 3 bytes
- Maximum record length 32767 bytes
- Maximum fields per record 32767
- Maximum records per file 16 million
- Maximum files per program 16
- Maximum open files
- Operating system limit

PROGRAMS

- ☐ Define record layout
- ☐ Create new indexed file
- ☐ Generate standard screen-form program
- ☐ Generate standard report program
- ☐ Compile screen-form program
- ☐ Compile report program
- ☐ Screen-form program interpreter
- ☐ Report program interpreter
- ☐ Menu interpreter

SCREEN-FORM LANGUAGE

- ☐ Programmer defined options and logic
- ☐ Multiple files open in one program
- ☐ Default or programmer processing of exception conditions
- ☐ Powerful verbs for input, display and file access
- ☐ Simultaneous display of multiple records
- ☐ Facility to call sub-programs and operating system commands
- ☐ Conditional statements
- ☐ Subroutines
- ☐ Independent of terminal type

INTRODUCTION

This chapter begins with a statement by Dennis Ritchie concerning the ANSI C standards committee. He placed it on USENET, with the usual disclaimer that the opinions expressed are his, and not those of his employer. It is reprinted here verbatim, without editing. For those who do not recognize the name, he is the "R" of "K" and "R".

For the tenth anniversary of the original publication of the K & R book on the C language, there is a new edition, encompassing the new features which have been added to the language in the last ten years. Although it attempts to cover the new ANSI C standard, be aware that the standard is still changing and some features noted in the book have been deleted from the standard. This includes the "noalias" keyword. The "volatile" keyword may also be modified in meaning before the standard is finalized.

Following the statement by Ritchie are commentaries (also from USENET) by others concerning various aspects of the C language. Their arguments show that the C language definition needs additional specification in several areas.

The example program produces text suitable for input to a text processor, such as nro, from plain text not containing the necessary commands.

EVALUATING ANSI C - Dennis Ritchie

Since the subject has come up, this is a good time to record my thoughts on ANSI C and the work that X3J11 has done. In brief, I think the result is commendable. I concur in the belief of those who watch such things that X3J11 managed to improve on what they started with, and that this is an unusual accomplishment for a large committee that lasts for 5 years or so. In particular, they successfully resisted the usually inexorable pressure to add features and options.

The committee had certain explicit goals, among them to bring the language specification up to date with reality, since much had changed in the 10 years since the original definition; to add a very few things deemed necessary (function prototypes); and to specify things more completely than K&R did. They also wanted to standardize the library, something that has become important not

only because of the drift in the System V vs. BSD worlds, but even more because of the vastly increased use of C on non-Unix systems.

Perhaps as important as all the rest was a goal that was not stated explicitly, namely to supply the stability, legitimacy and general cachet that is possible only with all the legalities required to get the result accepted as an Official Standard by the appropriate Official Bodies. The need for this can be questioned, but the fact that many people want it to happen, and that it tends to occur regardless of desires, can't be denied.

I have only a few worries about the specification of the language.

First, the introduction of the new function declaration mechanism. The new scheme is better than the old, but the change is going to cause trouble, and the need to accommodate both ways confuses the language specification and will confuse users. I made my peace with the change some years ago: it is better to do it than not.

Second, I don't think type qualifiers have been fully digested. I never did object very strongly to volatile, even though I maintain that it is not onerous to live without it. The remaining qualifier, const, suffers from tension between conflicting views of what it is supposed to mean. One possible view is that const things are real constants. If it prevailed, then one would expect that things of type const could appear where constants are expected (case labels and so forth). Perhaps even the notion of pointer to constant would become suspect. This was not the view that the committee eventually adopted, although (perhaps unconscious) sentiment for it remains; instead, a more implementation-minded approach was taken, namely that const means something that can be put in ROM (hardware or write-protected memory). Nevertheless, the tension remains, and figured heavily in the committee's arguments over seemingly unrelated things (including noalias). Even now, questions of whether a pointer to const can be assigned to an ordinary pointer, or whether these two types are compatible (and when compatibility matters) are lively issues. It is clear that the rules on qualifiers are to some extent artificial—they could be decided in several ways. Good rules are not arbitrary, they are forced by the logic of the design.

Some of the things that people are complaining about were completely necessary, in particular the insistence that only a fixed set of library routines is defined, that initial _ is reserved for the implementation, and that all other names are reserved for the user. It is just not possible to write a standard that permits the implementation to intrude into the user's name space (by letting it define names internal to its library that the user might use by accident), or to give a defined, standard way for the user to replace system routines. The latter would constrain implementations too much. At the same time, the consequences of such rules are misunderstood. A program that calls "read" is not defined by the standard, but I assure you that the supplier of your Unix system will arrange that it works.

X3J11 did miss some opportunities. Perhaps the most obvious lack in the language is a scheme for variadic arrays. However, the proposals I have seen are awkward and don't fit smoothly, so it is not surprising that nothing was done.

Another thing that must await the future is a genuine rethinking of integer arithmetic, not just the fiddles that they did.

All in all, I think X3J11 did an excellent job. When they began, several years ago, I was somewhat apprehensive about what would result, but also decided that I did not have the stamina to become involved in their activities; I would have to trust their good sense. I have never regretted the decision, and I'm pleased with the outcome.

OVERLOADING C OPERATORS

The following commentary is due to Frank Byrum of BROOKS Financial Systems, Inc.

They recently experienced an exceptionally insidious error in their production code, which was causing sporadic write failures on execution. This error successfully eluded detection by a DOS compiler as well as by a full linting under Unix System V Release 3.

The intent was to have the following C code:

```
if((lpfd = open(printer_string(PORT), O_WRONLY)) < 0)
    (fatal_error_message) ... ;
    write(lpfd, ... , ...);
```

In English, if the return value from open()ing the printer as assigned to lpfd is not a valid file descriptor, quit; else use it.

Unfortunately, what was actually coded was the following:

```
if((lpfd = open(printer_string(PORT)), O_WRONLY) < 0)
    (fatal_error_message) ... ;
    write(lpfd, ... , ...);
```

Take careful notice of the change in parenthesizing. These statements constitute perfectly legal C. Notice first that open() is called with an insufficient number of arguments. The stream's status will be based on a random value taken from the stack!

Whether this value implies writability is a random parameter, hence the variable nature of the bug. The comma is now a comma operator, since it is outside the function brackets. Assignment takes precedence over the comma operator, so lpfd is indeed assigned the return value from open(), but this entire assignment now constitutes the left side of a comma expression, so it is the value of O_WRONLY that is compared against 0! O_WRONLY is defined as a positive constant, so the test always fails and attempted execution of the write() becomes inevitable.

The lint program did not report an argument count error for open(). It so happens that open() is one of the few system calls that can take a variable number of arguments (depending in this case on whether the O_CREAT flag is included in the second argument). Hence lint's argument count check is suppressed by the /*VARARGS2*/ modifier in llib-lc.

It took them a very long time to find the problem, as could be imagined.

He noted that C's overloading of certain operators (in this case, the lowly comma) increases the probability that an erroneous code fragment will be legally interpretable, a situation somewhat analogous to having too many words in a spellchecking dictionary. This lead directly to the compiler not locating the logic error, since it was not considered a syntax error.

GOTOS FURTHER DEBATED

The following section was written by William Wells of Proximity Technology of Fort Lauderdale, Florida. As usual, his opinions are his own, not his employer's.

Under ordinary circumstances, there is exactly one place where a human C coder might use a goto. This is to implement multi-level breaks and continues.

I say this, having managed (and written huge chunks of) a 17,000 line software system (and that is only the part we sell, and does not include development tools). I have programmed in C for six years now and have NEVER used a goto. We have uncounted megabytes of C code written in-house. None of it (to my knowledge) contains a goto. The closest thing we have to a goto is setjmp/longjmp, used to implement a multi-level return (and that is a recent change, one whose contemplation caused much debate).

With that aside, let me explain why the goto discussion is really fruitless. People have observed that gotos are used in a lot of bad code. From this it is concluded that gotos are bad. This is really bad logic. Try this: programmers have been observed to write bad code; therefore, programmers are bad!

There is nothing wrong with goto. How do I reconcile with my statements above? Wait and see... The thing that is wrong is the control structures being implemented with the gotos.

The whole point of the structured programming debate is this: every program has a control structure; some of these control structures are better than others. Whether you use `gotos` or some other language feature to implement the control structure does not change what the control structure is nor does it affect the goodness of the control structure.

The quality of your program is strongly influenced by the quality of its control structures. Furthermore, you want that control structure to be obvious and understandable to the reader of the program. This implies that you use language features that make your use of a control structure obvious.

So, the first question should be: what are the good control structures?

The second question should be: given a particular language, how should the control structures be implemented?

Ok, so what makes a control structure good? Well, the basic answers are: a control structure is good if it is

- 1) appropriate to solving problems.
- 2) easy to write.
- 3) easy to understand.
- 4) easy to maintain.
- 5) ... add your own as long as they do not contradict the above.

There are obviously lots of control structures that meet these requirements and you do not have to use all of them. In fact, you should pick a set of those which are most appropriate for your programming environment and use them. This set should be, in some sense, a minimum one; for example, if you have two control structures which can accomplish the same thing, but one is easier to use than the other (for you), pick the easier one and forget the other. All other things being equal, a smaller number of control structures helps make your program easier to understand.

Now, I hope my claim about our C programs is understandable. But if not, here is what it amounts to: I have chosen a set of control structures which is appropriate to programming in C, for the kind of programming tasks that I do. It happens that, while my set of control structures includes multi-level breaks and continues (which would be implemented with a `goto`), I have never had need of one. Given the amount of code I write, it seems to me that one might never need to use an explicit `goto` in C code.

Now that I think of it, here is a reason to avoid naked `gotos` in C code: for all other constructs, the control structure being implemented is obvious from the keywords employed. This is not true for `goto`. Therefore, supposing that you have found a control structure that you have to implement using `gotos` in C, you should dress the `goto` up. As an example, suppose that you are using the state machine control structure.

I normally code it as the following:

```
state = STATE_INIT;
while (state != STATE_DONE)
{
    switch (state)
    {
        case STATE_INIT:
            ...
    }
}
```

However, this is not the most efficient way to do it. You could also implement it as the following:

/* Wherever you see the macros `state` and `nextstate` being used, you will be seeing a state machine. The `state` macro defines the start of a state. The `nextstate` macro causes a transfer of control to another state of the same machine. A state machine starts at a `define` of `statepref` and ends with `state(DONE)`. */

```
#define dummy(x)      x
#define state(x)      dummy(statepref)x
#define nextstate(x)  goto dummy(statepref)x

#define statepref
#undef statepref
#ifdef statepref
#define statepref     STATE_

state(INIT):
    (code for this state)
    nextstate(DONE);
    (more states with appropriate code)
state(DONE):
    (code after state machine)
```

I am aware that not all preprocessors will do what I want here; for real portability, you would explicitly write the prefixes. Also, this method fails for nested state machines, something I have occasionally had need of.

Some of you will no doubt be thinking: but why should I go to all this effort when I could just use the `goto` directly? Well, if this was all you did with `goto`, I don't really see any reason why not (but I do think your program should include a comment saying that you use `goto` for state machines and describes how you structure it). If, however, you have more than one way of using `goto`, you should clothe the `gotos` somehow so that the reader of the program knows what control structure your `goto` belongs to. After all, a while is just a disguised `goto`.

WHITE-SPACE IN C SYNTAX

Almost without exception, white-space may be included or excluded from C programs without affecting the logic of the program. The obvious exceptions are within quoted strings, identifiers, keywords, numbers, and multi-character symbols, where white-space may not be included without splitting one unit into two.

A problem in some of the earliest C compilers, which is described in the original K & R book as being an anachronism, was the older form of the binary-operator/assignment statement. Rather than being coded as `i = 1`, it was coded as `i -= 1`, leading to the possibility of an ambiguity if the spaces were removed, since `i-=1` could represent a binary-operator/assignment statement or an assignment statement. Unfortunately, some of the current C compilers accept this syntax, either silently or with warnings.

Certain implementations of the C language, especially older ones, had dependencies and peculiarities which made white-space significant in unexpected contexts.

For example, one C compiler required no white-space between an array name and the open bracket introducing the first array dimension. This situation generated only syntax errors and some grumbling on the part of the programmers attempting to use the compiler.

Another C compiler required no white-space between a function name and the open parenthesis introducing the function arguments. Again, this was primarily a nuisance.

The same C compiler required no white-space between a parameteric define name and the open parenthesis introducing its arguments. Unfortunately, if it found no adjacent open parenthesis, it assumed that the arguments were all null and expanded the define. Then, it encountered the open parenthesis and evaluated the arguments of the define as expressions separated by comma operators. If the programmer were lucky, the compiler generated a syntax error. However, in many cases, the compiler silently generated incorrect code because it mis-interpreted the statement.

C compilers conforming to the ANSI C standard must treat comments syntactically as white-space. Many older compilers, and several current ones, treat comments as if they were not present. The difference is probably academic, but may cause minor portability difficulties.

There is one ambiguity in the C language definition which has been present since essentially the beginning and continues into the ANSI C standard. If a divide operator is immediately followed by the asterisk of a dereferencing pointer operation, the result will be indistinguishable from the `"/"` multi-character symbol introducing a comment. This will cause a problem in any C program containing this sequence, but it will be exceptionally severe with current C compilers which do not support nested comments, as the resulting comment will encompass all code up to and including the next comment.

The easiest manner in which to avoid most ambiguity is to use white-space liberally. This assists both the human and the computer in interpreting the program correctly.

C PROBLEM

Following is a puzzle on unsigned promotions, posed by Steve Friedl of V-Systems, Inc. It illustrates a portability issue with sign extension.

Can any of you help with a puzzle? I've been trying to understand the unsigned vs value preserving rules of various C compilers, and I'm afraid I've run into a case I don't understand. I have pored over the dpANS on this but am still confused.

Note that this question applies to all compilers, not just dsANSI ones.

```
/* what is printed? */
#define      MINUS_ONE      0xffff

main()
{
    unsigned short    aval;
    long lval1, lval2;

    aval = MINUS_ONE;

    lval1 = - aval;
    lval2 = - (unsigned short) MINUS_ONE;

    printf("lval 1 = %ld    2 = %ld\n", lval1, lval2);
}
```

The normal answer I get is:

```
lval 1 = -65535    2 = -65535
```

but on the HP9000 I see:

```
lval 1 = 1        2 = -65535
```

For what it's worth, the HP9000 has `sizeof(short) = 2` and `sizeof(int) = 4`, and I get the same results when I define `MINUS_ONE` to be `(-1)` or `0xffff`.

My specific questions:

- (1) is this a case of questionable unsigned-ness?
- (2) if I have a vendor who asserts "this is a value-preserving compiler", what is the necessary value of "lval"?
- (3) if I have a vendor who asserts "this is a unsigned-preserving compiler", what is the necessary value of "lval"?
- (4) if I have a vendor who asserts "this is a dpANS-conformant" compiler", what is the necessary value of "lval"?

EXAMPLE C PROGRAM

Following is this month's example C program; it converts text files to a simple nro format. It assumes that text begins in the first column and that non-text (tables, etc.) begins in other than the first column. By changing the commands somewhat, the program could be modified to output commands for another text processor.

```
#include <stdio.h>
#include <ctype.h>

char *p;
char string[256];
int i;
int n;
int s;
int t;

main(argc, argv)
int argc;
char *argv[];
{
    while (fgets(string, 256, stdin))
    {
        if (*string > ' ')
        {
            if (!i)
                i = 0, fputs(".fin", stdout);
            if (t)
                t = 0, fputs(".in 0n", stdout);
            if (s)
                printf(".ap 8dn", s), s = 0;
            fputs(string, stdout);
        }
        else
        {
            for (p = string, n = 0;
                 isspace(*p); ++p, ++n);
            if (*p)
            {
                if (!i)
                    i = 1, fputs(".nfn", stdout);
                if (t != n)
                    printf(".in 8dn", t = n);
                if (s)
                    printf(".ap 8dn", s), s = 0;
                fputs(p, stdout);
            }
            else
                ++s;
        }
    }
}
```

Ann Arbor, MI 48105

USER

NOTES

From Basic Assembler to HLL's

Centcolumnal

This is my 100th column, though not all 100 have appeared in 68 Micro Journal. Way back when, I started out to publish a newsletter, advertised in "Kilobaud Microcomputing" via letter. I had printed, duplicated and distributed 8 newsletters when Don Williams phoned one evening to ask if I would like to switch to writing a column for '68' Micro. I said that would be fine, but I had committed myself to 12 newsletters, and had collected a small fee that would just about cover cost of duplication and mailing. Don said that he would send four issues of '68' to my list of about 25 initial subscribers to fulfill my obligation. Of course, my "column" was then read by a few thousand hobbyists rather than just 25 of them. That means that I have written some 92 columns for 68 Micro Journal, and I've missed more or less 4 times (including two recently). That means that it has been just about 8 years that I've been here in this spot.

My early columns included a lot of software listings, mostly utilities for the 6800 FLEX09 operating system. When the 6809 came along, I did the same for that. I had little choice, since

there really wasn't much to talk about in software available for those early microcomputers. Technical Systems Consultants had an ad very early in Kilobaud, selling some little games that would run on a KIM-1 board with terminal attached. The games were fun but truly primitive by today's standards. There was HANGMAN, of course, and REVERSE in which you tried to order ten digits that had been randomized by reversing some fraction of them from a given position on to the end. The KIM-1 was a 6502 based single board computer with 256 BYTES of RAM. Before the addition of extra memory and a terminal it ran little games on its 6 seven segment LED displays. It had a keypad with which you could explore memory or enter programs a byte at a time. Programs could be saved to audio tape and loaded from it as well. There was a KIM-1 newsletter in which were published little games, such as a horse race in which the three horizontal bars of the seven segment displays were illuminated in turn advancing from left to right based on a random number generator. The first one to make it across the 6 digits was, of course, the winning horse.

Eventually I found a Tiny Basic for it, and attached a 4K memory board, adapting its S-100 bus to the KIM bus.

About January 1977 I ordered my Southwest Technical Products 6800 box and a terminal that consisted of a keyboard and a logic circuit board that included a character generator etc. I attached an old television set and the combination could be used as a 40 column terminal! SWTPC used a cassette as the software medium at a whopping 300 baud transfer rate. I remember starting "16K BASIC" loading to the computer and breaking for supper. When I came back either BASIC was running or I had an error message and had to start over again. TSC offered their games in 6800 version and I bought those again. Then they offered an assembler and a line editor. I bought both (to save money) in source code form and typed in the HEX DUMP to get them running. That was an exercise in frustration, searching for a wrong byte here and there in the code until it all worked correctly. Later I typed in the source code and got it assembled. SWTPC had a printer to go with the computer. You guessed it, it

printed 40 column on roughly 4 inch wide "adding machine" tape to match the 40 column display.

A year or so later, I bought a genuine ADM-3A terminal (with the option to allow both upper and lower case), and then a pair of 5 1/4 inch disk drives which came with a primitive disk operating system (that worked fine, I might add). Six months down the road from then, SWTPC sent all the customers who had bought floppy disk systems a copy of Miniflex, the first REAL operating system for the 68XX processors. I remember that they had stuck the disk in the middle of their printed manual and sent it in a 9 by 12 envelope which the mail man nicely folded in half the long way, to fit the mailbox. I improvised and found that I could remove the magnetic medium from the disk jacket by cutting one edge of the jacket open. Then I did the same with a good jacket and moved the insides to that. I could then read the disk and copy it to a good disk and I was running Miniflex. TSC offered their line editor EDIT and their assembler ASMB again, and this time I bought them on disk. TSC supplied printed source code. They did the same for their text processor called simply PR. I bought that as well. There was a very early compiler by Jack Hemmenway called Strubal (STRUctured BASic Language). I can't say much more for it than to say that it worked. I typed in a 6 or 7 page program and the compiler output overflowed memory! (I had 32K at the time). Lucidata released their 6800 Pascal Pcode compiler that was many times more efficient at code generation... (Not a knock for Hemmenway, just progress happening).

Shortly, TSC came along with their DEBUG program that let the user single step through a program, set break points, etc. I wondered at the time how I had ever debugged an assembler program without it.

A year or two after that I upgraded by buying a 6809 processor board and a lot more memory for the system. It originally had 16K but I had previously upgraded to 32K and now I went to 48K and then 56K (the maximum possible in that computer system). FLEX09 came along for the 6809 and went through a few upgrades. Then started the era of fast and furious development in the area of software. Lots of software was developed by hobbyists and then sold through '68' Micro Journal and other sources. If I am correct, only Technical Systems Consultants and Percom, and perhaps SWTPC itself supplied software that was specifically written with profit in mind, at least early on.

There was TSC's original Text Editor and Processor combination (updated to 6809 FLEX version), their Assembler, Lucidata's Pascal compiler, followed by a couple of "C" compilers. The first, from a little company that will remain nameless, was a disaster. The author was not a great programmer, but worse the company hadn't the vaguest idea how to test software. There were so many bugs that a program compiled under it seldom ran correctly. Later Windrush Microsystems in England released a "C" compiler by James McCosh that was as good as the earlier one was bad. McCosh is a good programmer, and Windrush knows how to test software and respond to bugs reported by

users. I still use that "C" now and then when I fire up the 6809 system. It is, in fact a direct ancestor of Microware's present OS9 68K "C" compiler. The folks from Microware might say that it has come a long way since then, and I'd agree heartily to that. Other software that came from that era was the PL9 compiler, Stylo Text Editor, OmegaSoft Pascal, PIE text editor, a couple of implementations of FORTH, and much more. About the end of the 6809 era I received a COBOL compiler for evaluation. Just about every new piece of software that came along (most or all of them were written in Assembler) showed a greater understanding of how to program a 6809. The compilers each generated better and smaller code than their predecessors. One peculiar language came along that was very good at doing things I don't normally do in my programs and terrible at doing things that I usually do. I let someone else review it and it got a fair write up.

Then, along came IBM with their PC and PC-XT and the big switch began. Many of the 6809 users remained loyal and we wrote much of our own software, but it became evident that there would be no more commercial software available for these systems. I wrote PAT, an editor which was about a year's worth of spare time effort. I figure I've probably cleared about a dollar an hour for that effort, but it wasn't done to get rich. I really did it to prove that good software could be written in a higher level language (PL9), and that it could be sufficiently small to leave a reasonable edit buffer, and run fast enough to be adequately usable. I did end up coding about 3% of it in Assembler as

ASMPROCs in order to speed up some very processor intensive operations such as string searches.

(I am at the point now with the 68000 systems where I was back about a year after the 6809 came along. Software is limited but coming. I've managed to get enough together to do whatever I want to do, and I've filled in with some "homemade" utilities in assembler, all of which have been published here at various times).

Somewhere along the era of all the new software arriving for the 6809, I began to slant the column more toward programming in higher level languages, and in reviewing the various offerings from the suppliers. I got in deep trouble with a few readers by saying once that I would choke (or worse) if I saw yet another COPY or DIRectory utility for the 6809 published. My comments by pure coincidence appeared in the column just about the time a reader sent me a disk with some nice things on it, but including a directory utility. The writer took personal offense and didn't believe that my comments were not aimed at him specifically! I got a very nasty letter and wrote a couple letters of explanation which must have been transferred directly to the garbage, because there was never another response. (About then I thought seriously about quitting this column). With regard to the comment about Copy or Directory utilities, what I had in mind was that computers had to serve some useful purpose beyond allowing their users to create more utility programs for the operating system. One "hacker" (I don't use the term in any sort of derogatory sense) wrote and told me that he

didn't intend ever to do anything useful with his computer! I've since adopted a similar attitude toward the more typical computer uses. I told someone that I would quit my job if I ever had to work with or on Database software or a Spreadsheet. I do appreciate the value of such software and computer uses, but they are not for me. I am an Electrical Engineer by education, and I immediately saw applications in the field of instrumentation and control of machines. It is in that area where my interests lie. So much for history except to note that the name of this file is NOTES100. Since 1000 months is 83 years and 4 months, I'm sure I won't have to shorten the name after the 999th column!

As you may have noticed, I'm back into hacking again, writing new utilities for the 68000 and SK*DOS. Should any of you think that after ten or twelve years, it must be a total breeze for someone to write programs, let me tell you about last night. A couple of days ago I decided that a rewrite of my text processor JUST was long overdue. I first wanted to set it up to read a printer configuration file so that the text processor software could be fixed and constant. The user could then prepare his own printer configuration file using only printable characters to represent the control sequences. That turned out to be a relatively easy one-evening plus, project. Then I decided to try to clean up some of the procedures, which had "grown" from the initial "keep it simple" concept to have features added and more features added. I was successful in getting it to correctly center and right justify a line in double wide printing mode, and decided that it

would be nice to fix it so it could justify a line with double wide printing in it also.

Having done similar things before, I made a careful backup of what I had that worked correctly, and set off to make the necessary changes. That was about 9:00 in the evening. Things went from not working to still not working to not working as well as before, to total garbage. At one point, I actually was printing out every other letter in the line with a blank space between! Finally about 1:30 AM, I conceded defeat and threw away my new effort and reloaded my backup. In the four hours of effort, I had found and fixed one bug, so I added the fix to the original file. I guess I'll stare at a listing and let that project sit for a while. The time was not wasted, since I now have gotten back into the program and have a much better feel for how I had done it several years ago. A rewrite will be based on what I learned. My procedures were all much too interdependent. I'd change one line and something that ought to be totally unrelated would no longer function properly.

When I was a lot younger and living in Chicago, I had a friend named Dick Neilsen. Dick always had a "shortcut" to get somewhere. Taking Dick's shortcut usually resulted in getting lost and taking twice as long to reach the destination. Among Dick's friends we began referring to doing something the hard way as a "Dick Neilsen Shortcut". Sometimes a poorly thought out shortcut in trying to write a program is just that, i.e. doing it the hard way. When that happens, it is usually best to think about the problem a little more and then try

again. I had a few good ideas and a couple of nights later I started again and made at least some progress. I now have a couple of new versions of JUST both working and doing more than the old one, but they are lacking in some of the features that I want to add.

I am obviously too much of the "start programming and get something working, and then clean it up later", school. I think some programmers go too far in the direction of getting it absolutely right on paper and expecting it to work on the first try. I've said that there is a middle ground that should result in minimum overall programming and debug time, and I observe that when I spend about equal amounts of time programming and debugging, I seem to get the job done fastest. I maintain that if I were to spend three times as long writing the program, I would have about 1/3 as many bugs, so that the program plus debug time would be about 3 1/3 units. Equal program and debug time would add up to 2 time units. Similarly, 1/2 the programming time would result in 2 times as much debug time, so that the minimum is about where the program and debug time are equal. I realize that this is not something that can be derived mathematically nor proven rigorously with logic propositions, (nor for that matter anticipated before the debug is done) but it would seem to be verifiable by experience. If I find that I spent too long debugging the last program, I spend more time writing the next, etc.

Based on my experience of the other night, I conclude that I didn't understand the problem thoroughly enough to be able to program well. In many instances when I write a program, I don't know exactly what it has to do until I take a good stab at it and try it. Then what it has to do sometimes becomes very obvious, and turns out to be significantly different from the original concept. This is particularly true in the area of machine control and instrumentation, though I am sure it carries into other programming areas as well. If the problem is REALLY spelled out well, that is a different case, but I don't believe that happens in practice nearly as often as the theorists would have us think.

Let me give you an example of this. I have been working on a word processor again, so I'll use that. How do we read text from a file with ragged right margin, not necessarily with every line filled as full as possible, and print it out fully justified, i.e. each line the same length (by inserting spaces in the line). A first approach might be to read characters from the input file until you have LENGTH characters. If you come across a CR change it to a space. Now back up through the partial word at the end of the line (if it is partial) and past the space that separates it from the previous word. Of course you count the number of places backed up, and then add that many spaces within the line. You put a CR at the end of the line and then print it. (How you distribute the extra spaces is another problem we'll assume you have solved). Now move the partial word left over from that line to the start of the next line and repeat the process until end of file.

If you do that, you will, of course have run the whole file together into one big paragraph. Titles and headers are not part of a paragraph. Of course you must have a way to tell when a paragraph has started and only treat the text within a paragraph as described above. Some authors of text processors choose to make a paragraph one long line. That is, the editor is set up to handle formatting on the screen without any CRs in the text. That simplifies the identification of a paragraph, but the file is hard to list using an ordinary list utility. I chose to use a signal inserted in the text to mark the start of a paragraph. ".p" all by itself on a line signals that a paragraph starts on the next line. The end of a paragraph is detected by two consecutive CRs (a blank line after the end of the paragraph) or another .P signaling the start of a new paragraph. When the paragraph is ended, a partial line might remain in the line buffer. Of course it has to be printed too, and it might as well not have extra spaces in it since it will probably not be a full line anyway.

Do you see what I am getting at? Unless you are an absolute genius (or at least a lot smarter than I), you won't think of all the conditions and exceptions without making a stab at a way to solve the problem and trying it to see what happens. Trying to write a program that is correct the first try is like trying to think up all the conditions and exceptions without trying what you have done so far to see if it works. More experienced programmers at least think of how a process like that described in the previous paragraph must start and stop, and perhaps they catch a few

more of the exceptions, but to try to catch them all without "experimenting" would seem to me to be a great waste of time.

Epson "Enhancement"?

A few months ago I saw an add in Computer Shopper for a new ROM to upgrade an Epson MX-80 among other models. I have a very old one that still works like new. I had upgraded it a long time ago with GRAFTRAX, the Epson upgrade, but of course it still didn't have "NLQ" mode. The ad for an upgrade kit called "Dots-Perfect" indicated that the upgrade would add letter quality and control of printing mode via the Online, Formfeed, and linefeed buttons, more or less like the newer Epsens.

I sent for the upgrade and it has arrived. I followed the instructions and it all worked pretty much as advertised on the first try, but the "NLQ" looks pretty bad, in fact not as good as just printing in Emphasized mode as I had been doing with that printer ever since I bought it. Certainly it doesn't compare with the LX-800 in either of its NLQ modes in which the characters look very full and smooth even under a magnifying glass. Vertical lines are quite obviously zigzag. It appears that the NLQ is achieved by simply shifting the carriage and overstriking.

The "upgrade" cost \$69. In my opinion, \$20 would be more in line with what it does, primarily based on the poor NLQ. The Epson MX-80 is capable of the same graphics resolution as the new LX-800, so there is no reason that a better NLQ font couldn't be done, other than, perhaps, lack of ROM space for the font character definitions. The upgrade does allow selection of fonts and print styles using the On Line, Formfeed and Linefeed buttons as advertised, and those are also selectable via software compatible with the latest Epson LX-800. It even has a "small print" mode that is simply superscript mode, condensed mode, and half line feed all combined. That's nothing you couldn't do on any Epson with true half size superscripts and subscripts under software control. I suppose if I didn't know how to write or configure word processing software, I'd be more impressed.

It would think you'd be better off spending that \$70 as a significant fraction of the cost of a new Epson LX-800 or even a Citizen 180-D which can be had for around \$170. It is a nice little printer but its NLQ is a little thin compared to the LX-800.

CRASH!

I just found a way to crash my editor PAT. I'll mention it so you can avoid it if you are a PAT user. I accidentally typed ESC ^L. Of course ESC 65 ^L would set the line length to 65, but with no parameter the line length was set to 0. I didn't notice that, and tried to format a paragraph to zero width. The "BUSY" notice came on, and stayed there until I ran out of memory, at which point there was an error message and an exit to the monitor. Of course all my edit was lost. I'll trap the no-parameter case and make it not change the current line length. Meanwhile, PAT users be warned.

OF-Link from Sardis Technologies

At last, a way to combine FLEX and OS-9 Level II! Sardis Technologies has a real winner, here. If you have been reluctant to switch to the Color Computer and OS-9 because of a heavy investment in FLEX software, OF-Link could be the answer to your prayers. Now you can have all of the advantages of OS-9 without losing that hoard of FLEX software you have accumulated over the years.

I don't want to spend any time going over the virtues of OS-9 vis-a-vis FLEX, as I am sure that you have heard enough to be tired of that argument. Rather, I want to describe my reaction to running FLEX programs in this new environment.

First, let me say that not every program will work. I could not find any software in my admittedly small inventory of "regular" FLEX goodies which would not run completely as expected under OF-Link. However, the copy of *STYLOGRAPH* which I use is the one especially tailored to the CoCo FLEX sold by South East Media, and I was not able to finagle the patches to make it run under OF-Link. Similar troubles would arise with any software which does not use the standard FLEX hooks. The instructions which come with OF-Link give help with some popular software which has a problem, but this is still for "regular" FLEX programs.

There are stringent hardware requirements, also. You must have a CoCo3 with 512K of RAM and two disk drives; otherwise, you cannot install the system. However, once OF-Link has been installed, you then can manage with only one drive, although it will be inconvenient.

The reason that you **MUST** have two drives is that you must install D. P. Johnson's SDISK3 before you install OF-Link. Contact D.P. Johnson at 7655 SW Cedarcrest St., Portland, Oregon 97223, (503) 244-8152. See D.P. Johnson's ad on page 59. If you have a DMC "no halt" disk controller from Sardis, you have no problems, since you already have SDISK3. If, like me, you have a Tandy, Disto, or other controller, then you must separately obtain and install SDISK3. I followed this route with both the original Tandy controller and the Disto SCII, and built a working system on SSDD35 drives, so you can, too. Just follow the excellent directions exactly and literally, and don't free-lance!

Once you have a working system, you can use modpatch or the public domain dmode to change to any number of tracks you wish. I easily converted from SSDD35 to SSDD80 by way of dmode. Unfortunately, I could not get any sort of double-sided drives to work;

this may have been the result of conflicts with my particular hardware. Also, I could not get more than 2 physical drives to work, even though the manual gave me the impression that I could. However, I had no problem with as many as 4 logical drives, so this may not be a practical limitation.

There is one "gotcha" which comes from the peculiarities of OS-9 record locking, and not from OF-Link. In any case, each active FLEX device window must have its own virtual system file. In other words, if you have 3 windows running with FF9, you must have 3 separate virtual system files, one to support each device window. I solved this "problem" by having all but one of the virtual windows contain only FF9 and the absolute minimum of other files, such as FLEX.COR, etc. Only one of the virtual system files contains a full complement of FLEX utilities. This saves physical disk space. By naming the 3 files (remember that these are really OS-9 files in disguise) as fv1, fv2, and fv3, I can call each one as I setup /w1, /w2, and /w3. There is a way around this problem of record locking and it is described in the manual; but the technique I described above is the one recommended as being a lot safer and saner!

Be very careful when you start sharing FLEX files, since it is very easy to mess up the links between sectors and the free chain. If you should have this sort of accident, you are in for a real hassle recovering from it. Be warned!!!

Utilities, etc.

Several very useful utilities are included with OF-Link which make it easy to install and use. The ones I used the most, and I expect everybody will have about the same experience, are dpoke and newcrc. Dpoke lets you change an OS-9 file and newcrc updates the crc without the necessity of explicitly moving that file from and back to the disk.

There is also a simple monitor which will help in debugging FLEX programs. Unfortunately, this was not fully operational on the review-copy of OF-Link which I received, so I can't say more than that it certainly looks good.

FF9 under OF-Link

So much for the preliminaries, now for the important stuff!!

I think that the first question answered should be, "Why bother?" Well, that is the easiest question to answer. With OF-Link, you gain:

1. 80-column screen
2. windows
3. graphics
4. color

Ok, if OF-Link is so good, what do you lose? The only lost feature of FF9 that I have been able to identify, so far, is the direct interface to the machine. However, this is a characteristic of OS-9, and not solely of OF-Link. If you use your FLEX software for machine control, then you must either choose between the great conveniences of OF-Link and the necessity for writing OS-9 device

drivers or go back to your old system. No, I have not yet written a successful device driver from scratch—something I have to learn. It may be possible to use the OS-9 call F\$MAPBLK, as is done in FORTH09, but I have not worked that out, either.

The 80-column screen is a bigger improvement over the 51-column screen than I had ever expected. As of now, I have put aside my SS50 and separate terminal in favor of the CoCo3. This, in my not-so-humble opinion, alone is worth the cost of the software! I may resurrect the SS50 at some later date, but I can't imagine when or why that would be.

Windows let me have several copies of FF9 going at once, so that I can flick from one program to another just by pressing the <CLEAR> key. Again, I am sure that you have been inundated with praise for this feature of OS-9, so I won't spend time on the hard sell.

By graphics, I don't mean just the crude cartoons to the excellent art that is possible, but also the full business and engineering-style graphics that can be generated by the lowly EMIT.

Color is available, as expected. The options and limitations normally available under RSDOS or OS-9 are all there. If you have the hardware, you can access them.

Melding FF9 to OF-Link

OF-Link gives you the option of using the normal hardware FLEX disks or the virtual FLEX disks which actually are resident as OS-9 files; FLEX just thinks that they are the usual disk.

For use under OF-Link, the virtual disk is to be preferred. This is particularly true if you have a hard disk; you can easily partition it into FLEX and OS-9

segments. OS-9 would think that there were only OS-9 files present, and all of the OS-9 file utilities would work. However, don't try to use a FLEX file utility on one of the OS-9 virtual FLEX files; this is fatal! You can boot FLEX from the virtual disk on the hard disk, so you don't have to keep a floppy around just for that.

The virtual FLEX disk has 64 sectors per track, so you must modify the FF9 disk parameters accordingly. Assuming that you have formatted your virtual FLEX disk to have 24 tracks (to produce 368 screens), you would modify FF9 by entering:

```
24  \ TRK/DRV >BODY !
64  \ SEC/TRK >BODY !
1   \ BASETRK >BODY !
```

According to my calculations, a single virtual disk could have as much as 2032 screens, if the disk is large enough. Of course, a physical disk can have more than one virtual disk!

Summary

Do I like OF-Link? You bet I do!!
Do I recommend OF-Link? You bet I do!!

FORTH09 ver. 1.02

Dan Johnson has addressed my complaint about FORTH09 shadow screens which I expressed in my review last time. He now allows a command line option "-n" which eliminates any call to shadow screens, so you are not forced to provide for them. Thanks, Dan, I appreciate that!

FORTH09 has some quirks which take a bit of getting used to. These quirks are forced by OS-9 and are not something to be changed on a whim. The most obvious difference with a FORTH operating under OS-9, as opposed to another environment, is that ALL absolute addresses are illegal. Therefore, you cannot legally use jump vector tables.

My observation that the form shown in Screen #3 of my last column would work resulted from a peculiar set of circumstances. This will only work if you compile the screen each time you use it; you cannot run from a SAVED or a SAVESYSed binary file, since the absolute addresses would then be wrong! Dan also said that this would not work under Level I, so I did not bother to try it.

The proper way to do vectored execution in FORTH09 is through the MAYBE ... THEN AGAIN ... MAYBE NOT construct (I love Dan's choice of names). A workable definition is

```
: EXPERIMENT2 ( n - )
  MAYBE 0 EX0 1 EX1 2 EX2 3 EX3 MAYBE NOT ;
```

This definition will accomplish the same result as the set of definitions and commands I had shown in Screen #3.

Remember, the method shown in Screen #3 is still valid for other environments, just not for OS-9.

OS-9 access from FORTH09

Here is another example of how much I still have to learn about OS-9. I had read all the way through (tough going) the manual which came with my CoCo OS-9 Level II, but the significance of the few lines on manipulating the MMU did not register through all of the other noise. However, the documentation on FORTH09 finally woke me up.

One can easily make OS-9 calls directly from FORTH09, and Dan has provided most of the words one could ever expect to use. Furthermore, he has provided enough information so that definitions can be quickly written to cover the obscure calls that he did not bother with.

Among these calls are F\$ALLRAM, F\$MAPBLK, and F\$CLRBLK, which can be used to access directly any RAM within reach of the MMU. These words can be used to access any RAM block, so that FORTH09 is limited only by the available memory. I wonder if this kind of thing could be used to control a latch which bank-switched additional chunks of RAM, so that the CoCo3 could go even beyond the present 512K? I don't plan to try it, but I am curious.

Another way to access OS-9 is illustrated in the definitions contained in Screens 46-48. Actually, several features of FORTH09 are illustrated in these three screens.

I won't spend much time on the first two screens, since they were discussed in some detail in September, 1987. The only really important points, here, are in the use of VAR, instead of VARIABLE, to define ARG (line 3 of screen 46). Line 5 of screen 46 and line 7 of screen 48 are identical in showing how to place a value into a VAR. There is no FORTH need to use the loading command twice, but these screens come from my new FORTH09 utility file, so that screen 46 can be used with a reasonable default value in ARG, when it is loaded without screen 48. On the other hand, ARG is loaded in the definition of HARD just in case I might have used ARG somewhere else, so that the value got changed. This is simply cheap insurance against

an annoying crash!

Screen 48 shows the use of CR and SHELL, two words which are unique to FORTH09. CR places the address of the CR-terminated string on the Data Stack. The string literal must end with a ". SHELL then uses this address to pass the string along to the OS-9 shell for execution and then return control to FORTH09. As you can see, this causes the current date and time to be printed along with the screen listing.

Hardware control through FORTH09 under Level II

I may well be the only one in town who did not realize that, with FORTH09, I could directly access the hardware located at physical addresses \$FF00-\$FFFF. In other words, this command line:

```
fload forth -n #48k
```

gives me 8K, starting at logical \$C000 to play with through F\$ALLRAM, etc. and lets me write directly to the hardware I/O, such as the cassette motor relay, or anything else located at the physical addresses \$E000-\$FFFF.

I tried to do this hardware access from BASIC09, but I could not find a way to make it work in Level II. Undoubtedly, it must be illegal, since it is so desirable and easy! In any case, the whole thing is perfectly straight forward in FORTH09. For example:

```
: MOTORON 4 65313 C! ;
: MOTOROFF 52 65313 C! ;
```

Speaking of timing tests, I hope to include some benchmark results with FORTH09 in the near future. I am impressed with the speed of most of the operations; most of the ones that I have checked to date are faster than can be explained by the simple increase in processor speed!

```

The Mathematical Design of Digital Control Circuits

By: R. Jones
Micronics Research Corp.
33383 Lynn Ave., Abbotsford, B.C.
Canada V2S 1E2
Copyrighted © by R. Jones & CPI

No TEST last time, ergo no solutions either!

Mile 20 - heading for Mile 21.

Last time, we got introduced to Boolean matrices, and learned how to interpret a matrix to let us trace paths through its corresponding circuit, and we also met Pivotal Condensation, a technique which allowed us to derive a transmission function from a Boolean matrix. Now we'll learn the second of the two techniques I promised, which has certain advantages and also some disadvantages compared to the first.

LAPLACE'S DEVELOPMENT

Our second method, known as Laplace's Development, involves the reduction of our matrix-a to a final 3-by-3, or several 3-by-3s, which, for the benefit of those of you who are familiar with matrix and determinant theory in advanced algebra, will then be evaluated in the same way as a third-order determinant. Except that all "-" signs will be replaced by "+" signs, as there is no such thing as a minus sign in logic theory, at least not at the level at which we're using it. For those of you who've never even HEARD of a determinant, I'll explain everything that it's necessary for you to know in order to work with a third-order Boolean determinant, which is nothing more terrifying than an end-result 3-by-3 matrix to all intents and purposes.

For our first example, we'll begin with our matrix-a of Diagram 102, from which, as you'll see, we'll derive the function f_{12} in no time at all. For 4-by-4 matrices, Laplace's Development gives a very quick solution indeed, but tends to become increasingly cumbersome as we proceed to matrices of higher order, for which I'd recommend using Pivotal Condensation.

DERIVING A DETERMINANT FROM A FOURTH-ORDER MATRIX

You'll recall that in our first method we eliminated all nodes, commencing with the highest numbered node, until we ended up with only those of interest, namely nodes 1 and 2. Strange as it may seem, our new technique seems to do just the opposite. That is, as we're interested in the function f_{12} , WE BEGIN BY ELIMINATING ROW-1 AND COLUMN-2 ENTIRELY from matrix-a. Actually we'll just loop them in red, but, for all practical purposes we've scratched them out. Bang! They don't exist any more! How about that for a quick vanishing act? Then we write down all that remains, as in Diagram 104, and we have our third-order determinant. Note that there's no row-1 or column-2! Because of this fact, our determinant is strictly for f_{12} .

EVALUATING A THIRD-ORDER DETERMINANT

Diagram 104

DERIVING A FOURTH-ORDER DETERMINANT FROM A FIFTH-ORDER MATRIX

First of all, we'll establish that it's $f_{1,2}$ we're interested in, by eliminating entirely from 105a both row-1 and column-2 to give us the fourth-order determinant of 105b. Observe the convention of indicating a matrix with delimiters to the right and left, with a curved top and bottom, whereas a determinant is delimited with simple straight lines. So ... curved lines mean that the matrix, even a reduced one produced by pivotal condensation, precisely describes its original network. Straight lines indicate that at least one column and row have been COMPLETELY eliminated, and not absorbed into a new matrix, as happens with our first technique. It's possible, with experience, to read fourth-order determinants quite accurately, but as we're essentially lazy at heart we'll reduce ours to the simpler-to-handle third-order variety!

NOW FOR OUR THIRD-ORDER DETERMINANTS

We'll do this scientifically, by selecting ANY SINGLE ROW OR COLUMN for elimination, preferably one with as many 0-entries as possible. The reason for this will become clearer as we proceed! Here we have a choice of either row-2 or column-1 (there is no row-1), so let's select column-1 and loop it in red.

We're now going to work our way down the selected column, one element at a time, and omit the row in which this element occurs. This element will then be multiplied by (ANDed with) the 3-by-3 determinant which remains. In case this all sounds a little confusing, and I've no doubt that it does, just tag along with me as I actually do this. The first element in our selected column is 0, which, as I've just mentioned, has to be multiplied by some determinant. However, as 0 times anything is equal to 0, we've really got nothing to do here. See now why we love to have as many 0s as possible?

Anyway, moving down to the next element, "a", in row-3, we must mentally eliminate row-3 from our 4-by-4 determinant of 105b (keeping in mind that column-1 is already gone, in theory anyway), and create a little 3-by-3, which we've written in 105c, with an "a" to the left, as this is the element involved in the deleted column-1. Then down to the next element in this column, namely "c", eliminate row-4 in our minds, and write THIS remaining 3-by-3 with a "c" to its left, and a "+" sign between the two third-order determinants to indicate that they're going to be ADDED together (that is, ORed). And finally to element b' in column-1 of 105b which gives us the end determinant with a b' to its left. Now re-read my original instructions, and you should be able to follow them this time!

MINOR DETERMINANTS

These final determinants, not being the full determinant of 105b, are individually called "minors". And now comes the tedious task of evaluating these minors, as we did with the 3-by-3 of our earlier example, and multiplying each one by whatever is outside it. This is the time when I wish that the column had more 0s in it! It's got to be done, however, so let's get on with it, first of all setting out the expression in full.

$$\begin{aligned} & a(b + ed'a' + cd'd + bd'd' + ed + a'c) \\ & + c(bd + ea'a' + cd' + bd'a' + e + cda') \\ & + b'(bdd' + ea'd + c + ba' + ed' + cdd) \end{aligned}$$

Now comes the horrendous task of multiplying each line of this complex expression by the literal outside each set of parens. But first note that inside each set of parens a single literal occurs, and we can therefore eliminate any term which contains this literal. At the same time, any term which contains the complement of the literal OUTSIDE the parens may be eliminated, because when multiplied together we'll have the situation $xx'y$, and as we know from our basic Boolean algebra (we do remember, don't we?), $xx' = 0$, thereby cancelling out this term. We've also got several occurrences of this sort INSIDE the parens! So let's do this reduction first, to give us

$$a(b + ed) + c(bd + cd' + a'bd' + e + a'cd) + b'(a'de + c + d'e + cd)$$

which then multiplies out to

$$ab + ade + bcd + (cd' + a'bcd') + ce + a'cd + a'b'de + (b'c + b'cd) + b'd'e$$

I've highlighted two sets of terms inside parens. where we see that as the smaller term is contained in its entirety within the larger term, the larger term can disappear.

		$e=0$						$e=1$			
$cd \backslash ab$		00	01	11	10	$cd \backslash ab$		00	01	11	10
00				1		00	1		1	1	
01				1		01	1		1	1	
11	1	1	1	1	1	11	1	1	1	1	1
10	1	1	1	1	1	10	1	1	1	1	1

Diagram 106

The simplest way to finish off the simplification is to draw up a 5-variable K-map as in Diagram 106, and read out the expression as

$$f_{1,2} = ab + c + b'e$$

If this all seems like a lot of work from beginning to end, just imagine what would have been involved if we'd started off with a 6-by-6 matrix. this would have reduced to a 5-by-5 determinant, which would have reduced to five 4-by-4 first minors, EACH OF WHICH would then have reduced to four 3-by-3 second minors, for a grand total of twenty 3-by-3 minors to evaluate and simplify. Can you imagine this? Not that it would be EASY by the Pivotal Condensation method, but I think it would be far, far easier than this!!

MULTIPLE-OUTPUT NETWORKS AND BOOLEAN MATRICES

Now that we're rolling along nicely and smoothly, let's recall my earlier bit of info to the effect that Boolean matrices can keep track of several outputs simultaneously. We'll even complicate things a little, by making our outputs share part of the same network!

$$\begin{array}{c}
 \begin{array}{ccccc}
 & 1 & 2 & 3 & 4 & 5 \\
 \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{array} & \begin{bmatrix} 1 & 0 & 0 & a & c \\ 0 & 1 & a' & b & 0 \\ 0 & a' & 1 & 0 & e \\ a & b & 0 & 1 & d \\ c & 0 & e & d & 1 \end{bmatrix} & \begin{array}{ccccc}
 & 1 & 2 & 3 & 4 \\
 \begin{array}{c} 1 \\ 2 \\ 3 \\ 4 \end{array} & \begin{bmatrix} 1 & 0 & ce & a + cd \\ 0 & 1 & a' & b \\ ce & a' & 1 & de \\ a + cd & b & de & 1 \end{bmatrix}
 \end{array}
 \end{array}
 \quad (b) \quad (c)$$

$$\begin{array}{ccccc}
 & 1 & 2 & 3 & \\
 \begin{array}{c} 1 \\ 2 \\ 3 \end{array} & \begin{bmatrix} 1 & b(a + cd) & e(c + ad) \\ b(a + cd) & 1 & a' + bde \\ e(c + ad) & a' + bde & 1 \end{bmatrix} & & &
 \end{array}
 \quad (d)$$

Diagram 107

The circuit of Diagram 107a is a three-terminal network, with power input at node-1, two outputs (Z1 and Z2) at nodes 2 and 3, and two intermediate nodes, 4 and 5. Its Boolean matrix is shown in 107b, so we'll begin a preliminary, partial analysis by eliminating nodes 4 and 5 from matrix-a, leaving only the terminal nodes 1, 2 and 3.

First, let's eliminate node-5 by Pivotal Condensation, to produce matrix-b of 107c, and then node-4 to give matrix-c of 107d. Note that these are MATRICES, not DETERMINANTS, as we haven't actually eliminated anything, but merely CONDENSED our original matrix! In our final third-order matrix-c, element a_{12} details the paths from node-1 to node-2 (but NOT via node-3), a_{13} the paths *from node-1 to node-3 (but NOT via node-2), and a_{23} the paths from node-2 to node-3 (but NOT via node-1).

EVALUATING INDIVIDUAL PATHS

If we wish to find the expression which describes the complete transmission-function f_{12} , between nodes 1 and 2, we must eliminate node-3 by Pivotal Condensation, to produce

$$\begin{aligned} f_{12} &= b(a + cd) + e(c + ad)(a' + bde) \\ &= ab + bcd + (ce + ade)(a' + bde) \\ &= ab + bcd + a'ce + bcde + abde \\ &= ab + bcd + a'ce \end{aligned}$$

Note that the final term supplies power to Z1 via node-3! In similar vein, in order to find f_{13} we'd eliminate node-2 from 107d instead, and if, for some reason, we were interested in knowing under what conditions nodes 2 and 3 would be connected together, we'd eliminate node-1 instead. The finally cleaned up functions are given below, which you could check for yourselves by actually doing each evaluation.

$$\begin{aligned} f_{13} &= ce + ade + a'bcd \\ f_{23} &= a' + bce + bde \end{aligned}$$

A systematic method of node-elimination such as this gives us the transmission-function between any pair of nodes desired, automatically taking into account ALL possible paths through the network. Our other alternative is to actually trace out the paths in the circuit-diagram, always with the possibility that one or more paths would be overlooked. You'll have noticed that the Laws of Boolean Algebra really come into their own during this reduction process, as the work is made much simpler if the elements are simplified as we go along. For example, when reducing from 107c to 107d, the element c_{13} starts out as

$$ce + (a + cd)(de)$$

and instead of just inserting this complex little beast into element c_{13} , we multiply out and simplify first.

$$= ce + ade + cde \quad (cde \text{ vanishes because of } ce) \text{ to give } e(c + ad)$$

CONNECTION MATRICES AND OUTPUT MATRICES

A matrix such as that of 107b, which contains only one literal per element is known as a "primitive connection matrix", while matrices such as 107c or 107d, which contain more than one literal in any element, are called simply "connection matrices".

There's a third type of matrix, known as an "output matrix", which charts, not the physical connections in the network, but the FUNCTIONS describing the transmissions between nodes. As an example of an output matrix, we could draw up a 3-by-3 for our present circuit, and insert in each element the three transmission-functions just evaluated individually. Such a matrix would, in each element, give the complete transmission-function between the nodes forming its co-ordinates IRRESPECTIVE OF WHETHER SUCH A PATH GOES THROUGH ANOTHER NODE OR NOT, whereas a normal connection matrix describes the connections between these nodes BUT NOT VIA ANY OTHER NODE WHOSE NUMBER APPEARS IN THE MATRIX CO-ORDINATES.

The output matrix for the network of 107a is constructed by inserting the three transmission functions already worked out, as shown next.

$$\begin{matrix}
 & \begin{matrix} 1 & 2 & 3 \end{matrix} \\
 \begin{matrix} 1 \\ 2 \\ 3 \end{matrix} & \left(\begin{array}{ccc}
 1 & b(a + cd) + dce & ce + ade + a'bcd \\
 b(a + cd) + a'ce & 1 & d' + be(c + d) \\
 ce + ade + d'bcd & d' + be(c + d) & 1
 \end{array} \right)
 \end{matrix}$$

Diagram 108

The element d_{12} now gives, not the PATH between nodes 1 and 2, but the CONDITIONS (ALL the conditions) under which transmission will occur between these nodes. Take time out to think this over, so you're reasonably clear about the distinction between the matrices of 107d and 108, even though both of them belong to the SAME network.

That's got the ANALYSIS part of this thing out of the way, so now for SIMPLIFICATION. This will always be our line of attack, first analysis, then simplification, and then the big one - synthesis.

NETWORK SIMPLIFICATION BY BOOLEAN MATRICES

Are we all ready to move on in our study of Boolean matrices? If so, we'll illustrate the versatility of our new tool by eliminating, by Pivotal Condensation, the non-terminal nodes 3, 4 and 5 from the network of Diagram 109, thus deriving the FUNCTION f_{12} in its simplest form.

Diagram 109

In our previous examples, no simplification was possible, as was obvious from the final expressions derived. The matrix for circuit 109 and the subsequent step-by-step elimination of its non-terminal nodes are set out in Diagram 110. The finally simplified expression for f_{12} shows that the original network can be completely replaced by a single NO-contact on relay-D, as this is all that's necessary to specify the transmission-function between nodes 1 and 2. Without Boolean matrix techniques, we'd never be able to figure this out from the network, as it's quite a tough job even to figure out its Boolean expression directly!

$$\begin{matrix}
 & \begin{matrix} 1 & 2 & 3 & 4 & 5 \end{matrix} \\
 \begin{matrix} 1 \\ 2 \\ 3 \\ 4 \\ 5 \end{matrix} & \left(\begin{array}{ccccc}
 1 & 0 & a & 0 & d' \\
 0 & 1 & 0 & e & a+d \\
 a & 0 & 1 & d & 0 \\
 0 & e & d & 1 & d' \\
 a' & a+d & 0 & e' & 1
 \end{array} \right)
 \end{matrix}
 \quad
 \begin{matrix}
 & \begin{matrix} 1 & 2 & 3 & 4 \end{matrix} \\
 \begin{matrix} 1 \\ 2 \\ 3 \\ 4 \end{matrix} & \left(\begin{array}{cccc}
 1 & a'd & a & a'e' \\
 a'd & 1 & 0 & e+a+d \\
 a & 0 & 1 & d \\
 a'e' & e+a+d & d & 1
 \end{array} \right)
 \end{matrix}$$

(a)
(b)

$$\begin{matrix}
 & \begin{matrix} 1 & 2 & 3 \end{matrix} \\
 \begin{matrix} 1 \\ 2 \\ 3 \end{matrix} & \left(\begin{array}{ccc}
 1 & a'd & a+de' \\
 a'd & 1 & d \\
 a+de' & d & 1
 \end{array} \right)
 \end{matrix}
 \quad (c)$$

$$\begin{aligned}
 f_{12} &= a'd + d(a + de') \\
 &= a'd + ad + de' \\
 &= d(a' + a + e') = d(1 + e') = d
 \end{aligned}$$

Diagram 110

Suppose, in addition, that there were an additional output being taken off at node-4 to drive some other device, and we desired to know the transmission-function f_{14} , as well as f_{12} . Now we're getting a little complicated, to say the least, but let's go along with this assumption. Node-5 has already been eliminated in 110b, so we'll now proceed to eliminate nodes 2 and 3 (so only 1 and 4 will be left), commencing with node-3 to produce the matrix of Diagram 111a, from which we'll work out the function f_{14} , ending up with "a'e' + d".

$$\begin{array}{c}
 \begin{array}{ccc}
 & 1 & 2 & 4 \\
 \begin{array}{c} 1 \\ 2 \\ 4 \end{array} & \left(\begin{array}{ccc}
 1 & a'd & a'e' + ad \\
 a'd & 1 & e + a + d \\
 a'e' + ad & e + a + d & 1
 \end{array} \right) & \\
 & (a) &
 \end{array}
 \end{array}
 \quad
 \begin{array}{l}
 f_{14} = a'e' + ad + a'd(e + a + d) \\
 = a'e' + ad + a'de + a'd \\
 = a'e' + ad + a'd \\
 = a'e' + d(a + a') \\
 = a'e' + d
 \end{array}$$

Diagram 111

The COMBINED dual-output circuit of the two simplified functions is shown in 111b. But let's not forget, however, that MATRIX CONTRACTION YIELDS THE SIMPLEST FUNCTION, AND NOT NECESSARILY THE SIMPLEST CIRCUIT. If you don't believe me, just go back and look at the FUNCTION derived from matrix contraction in diagram 104, and the circuit diagram which we could reasonably expect to construct from it. The simplest CIRCUIT is, of course, the original one of 101, but the simplest FUNCTION describing it is that which describes the equivalent circuit of Diagram 100b. All clear?

MORE CHIT-CHAT

While matrix contraction yields the simplest transmission-function, matrix EXPANSION, which we'll be studying shortly, gives us a simplified circuit-diagram, if one exists. Don't be confused by the fact that matrix contraction has just given us a MUCH SIMPLER network, as it often happens that the simplest function is coincidentally the simplest circuit also. If this DOES occur, remember that it's just an accidental side-benefit derived from the true purpose of contraction, and you'll never be really sure whether it's truly the simplest circuit. Unless, of course, you end up with just a few simple contacts, and you can tell at a glance that it can't be reduced further.

And now it's TEST-time again for all you lucky people, so let's have a go at the following, but think carefully before you answer the question posed in Problem 2!

TEST FIFTEEN

1. Evaluate f_{12} by means of Laplace's Development, and draw the final circuit.

2. Nodes 1, 2 and 3 are terminal nodes. Eliminate nodes 4 and 5 by Pivotal Condensation, and draw the final circuit diagram. Is this a simpler circuit?

3. Evaluate f_{12} by means of Pivotal Condensation and draw the final circuit.

CAMP TIME AGAIN

Come on now, and admit that although this has been a VERY complicated few miles, this new stuff is nowhere near as terrifying as our encounter with the Laws-of-Boolean Swamp. And just think what it can do for your design skills!

Anyway, while you're working at these three problems, I'm debating whether to lead you into another of those word-logic problems, similar to that involved in Uncle Fred's experiences with I-asku of the M'bulyan tribe. I'll let you know when we're ready to move off once more.

... End of Mile 20. and all gathered round marker Mile-21.

This and That

Reviews of MaxPage and QuickLetter

*By James E. Law
1806 Rock Bluff Rd.
Hixson TN 37343*

This month I want to briefly review several new software packages starting with MaxPage which its distributor, Applied System and Technologies, describes as "the affordable page makeup program."

A Review of MaxPage

A logical part of us knows that you don't get something for nothing but in spite of this, we search for that rare deal where we get a treasure for pennies. Occasionally it works out but most of the time you get what you pay for. When I received a piece of software which advertised page layout capabilities for a suggested retail of \$89, my curiosity was peaked. Could it really deliver? Let's find out.

When you first open MaxPage, a blank page is presented with a set of menu bars. The page may be in landscape or portrait orientation. You may activate a grid (maximum size of 17" by 17") for ease in locating text or other items on the page. Oddly, the default settings are for the grid to print out when you print your page, but it may be ordered not to print. It is specially marked to facilitate the layout of bifolds and trifold. There is only one view of the page - full size - and no page preview is provided. This is an unforgivable omission for a page layout program!

Working With Text

To work with text, you first create a text block by clicking and dragging the cursor. Each text block has a drag handle for use in re sizing the block. You can move text blocks around and position them anywhere you like on a page. There can be up to 75 text blocks per page.

Upon sizing and positioning a text block, you can enter and edit text in the usual fashion. Multiple fonts and sizes within a text block are supported. Text can be typed into text blocks or imported from other applications. Text can be aligned left, right, or center but may not be flush justified. No tabs are available. MaxPage allows considerable control over line spacing. You can adjust the leading above or below the selected line or have leading automatically adjusted based on a number of options.

If you enter or import more text than a text block can hold, it stacks below the visible area of the text block. The hidden portion of the text can be seen by re sizing the block. This excess portion of the text can also be made to wrap over to a different text block on the same or a different page. This is a manual process that might work okay for a simple one or two page document but would not be practical for a more elaborate project.

Blocks are also used to accept and position PICT (draw-type) or PNTG (bit mapped) images. The image is automatically scaled to fill the active picture block. If you re size the block, the image is re sized. MaxPage takes a highly unusual approach to handling images in that the image is referenced to its location on your drive and is not really imported into MaxPage. Every time the page

is re drawn, the image is re-imported. This means that the image file must stay on the same disks as the MaxPage file. For a complex image, a noticeable delay occurs in redrawing the page. To avoid this delay, you may elect an option in which images are neither displayed or printed.

Backgrounds

MaxPage allows you to import a full page PICT image into your document as a "background." Unlike the image handling covered above, backgrounds are actually imported into and become part of your MaxPage document. This feature is intended to contain master elements (e.g., borders, letter heads, or logos) or to serve as a design template.

Conclusion

After my look at MaxPage, I conclude that you get what you pay for. . . maybe. What MaxPage has going for it is its cheap price. Disadvantages include the lack of page preview, no text tabs or justification, and nonstandard ways of handling graphics. If all you need is to lay out simple, occasion, single page, perhaps MaxPage will serve your needs. All in all, however, I cannot recommend this product..

A Review of QuickLetter

Over recent years there have been a number of mini word processors in desk accessory form for the Macintosh. The quality and number of features in those programs varied widely but with a few being quite powerful. I have just received QuickLetter from Working Software, Inc., and it is a jewel.

What it Does

QuickLetter is primarily designed for one thing -- writing letters. To that end it provides for setting up standard stationary (with letter heads and logos), maintaining an address book, importing addresses into your correspondence, and printing letters and envelopes.

When you open QuickLetter, you may use the default "stationary" (to be discussed later), open other McWrite or QuickLetter documents or create

a new document. Your document then appears as does a ruler (which may be hidden) with various tools and a set of menu bars. Your document may be either landscape or portrait orientation in any standard size.

QuickLetter's text tools are fairly standard so I won't detail them. A feature that I like is the ability to use text size up to 200. Also, in QuickLetter, you have more control over setting margins and line spacing than in MacWrite.

QuickLetter allows you to set up standard stationary to speed up the letter writing process. Such stationary already contains standard graphics features (e.g., letter heads borders and/or logos) margin and tab settings, and text specifications. One such stationary design may be designated as the default stationary and will automatically appear when you start QuickLetter.

You may import graphics for use as a logo or letterhead. Whatever you import is automatically placed in the upper left hand corner of the page and cannot be moved. This lack of flexibility is a significant weakness in QuickLetter. Considerable trial and error may be necessary to design the graphic so that when pasted into QuickLetter, it is corrected positioned.

QuickLetter contains a handy address book for in putting addresses to your letter or envelope. This feature also can be used to print labels. You may search the address book for key words such as a part of a name.

The print preview feature for QuickLetter is especially nice. Not only can you easily preview your letter and envelope as they will print but you can move the text around on the page independent of the letterhead to visually position it as you like.

The Bottom Line

In summary, this is an unexpected nice product. I keep finding useful features that I didn't expect to find. If the imported graphics could be more easily located, it would be perfect. But that weakness can be worked around and so, on the balance, QuickLetter's strengths outweigh its weaknesses and is recommended.

Assembler and Listing formats same as target CPU's format. Produces machine independent Motorola S-Text. Includes Macro Pre-Processor. Written in "C". 68000 or 6809 *Macintosh.* Atari. FLEX, CCF, UniFLEX, OS-9, XENIX, UNIX, MS-DOS, SK-DOS
any object \$50 or any 3 for \$100
any source is an additional \$50 or any 3 for \$100
Set of ALL object \$200.00 - with source \$500.00
- XASM Cross Assemblers for FLEX, SK-DOS** from S.E. MEDIA -- This set of 6800/1/2/3/5/8, 6301, 6502, 8080/5, and Z80 Cross Assemblers uses the familiar TSC Macro Assembler Command Line and Source Code format, Assembler options, etc., in providing code for target CPU's.
Complete set, FLEX, SK-DOS only - \$150.00

CRASMB from LLOYD I/O -- Supports Motorola's, Intel's, Zilog's, and other's CPU syntax for these 8-Bit microprocessors: 6800, 6801, 6303, 6804, 6805, 6809, 6811 (all varieties); 6502, 1802/5, 8048 family, 8051 family, 8080/85, Z8, Z80, and TMS-7000 family. Has MACROS, Local Labels, Label X-REF, Label Length to 30 Chars. Object code formats: Motorola S-Records (text), Intel HEX-Records (text), OS-9 (binary), and FLEX, SK-DOS (binary). Written in Assembler ... e.g. **Very Fast.**

CU TYPE - Price each:

For:	MOTOROLA	INTEL	OTHER	COMPLETE SET
FLEX9	\$150	\$150	\$150	\$399
SK-DOS	\$150	\$150	\$150	\$399
OS-9/6809	\$150	\$150	\$150	\$399
OS-9/68K	-----	-----	-----	\$432

CRASMB 1632 from LLOYD I/O -- Supports Motorola's 68000, and has same features as the 8 bit version. OS9/68K Object code format allows this cross assembler to be used in developing your programs for OS-9/68K on your OS-9/6809 computer.

FLEX, SK-DOS, CCF, OS-9/6809 \$249.00

COMMUNICATIONS

- CMODEM** Telecommunications Program from Computer Systems Consultants, Inc. -- Menu-Driven: supports Dumb-Terminal Mode, Upload and Download in non-protocol mode, and the CP/M "Modem7" Christensen protocol mode to enable communication capabilities for almost any requirement. Written in "C".
FLEX, SK-DOS, CCF, OS-9, UniFLEX, UNIX, XENIX, MS-DOS, with Source \$100.00 - without Source \$50.00
- X-TALK** from S.E. Media - X-TALK consists of two disks and a special cable, the hookup enables a 6809 SWTPC computer to dump UniFLEX files directly to the UniFLEX MUSTANG-020. This is the ONLY currently available method to transfer SWTPC 6809 UniFLEX files to a 68000 UniFLEX system. Gimix 6809 users may dump a 6809 UniFLEX file to a 6809 UniFLEX five inch disk and it is readable by the MUSTANG-020. The cable is specially prepared with internal connections to match the non-standard SWTPC SO/9 I/O Db25 connectors. A special SWTPC S+ cable set is also available. Users should specify which SWTPC system he/she wishes to communicate with the MUSTANG-020. The X-TALK software is furnished on two disks. One eight inch disk contains S.E. Media modem program C-MODEM (6809) and the other disk is a MUSTANG-020 five inch disk with C-MODEM (68020). Text and binary files may be directly transferred between the two systems. The C-MODEM programs are unaltered and perform as excellent modem programs also. X-TALK can be purchased with or without the special cables, but this special price is available to registered MUSTANG-020 users only.
X-TALK Complete (cable, 2 disks) \$99.95
X-TALK Software (2 disks only) \$69.95
X-TALK with CMODEM Source \$149.95
- XDATA** from S.E. Media - A COMMUNICATION Package for the UniFLEX Operating System. Use with CP/M, Main Frames, other UniFLEX Systems, etc. Verifies Transmission using checksum or CRC; Re-Transmits bad blocks, etc.
UniFLEX - \$299.99

PROGRAMMING LANGUAGES

PL/9 from Windrush Micro Systems -- By Graham Truitt. A combination Editor Compiler Debugger. Direct source-to-object compilation delivering fast, compact, re-entrant, ROM-able, PIC. 8 & 16-bit Integers & 6-digit Real numbers for all real-world problems. Direct control over ALL System resources, including interrupts. Comprehensive library support; simple Machine Code interface; step-by-step tracer for instant debugging. 500+ page Manual with tutorial guide.

FLEX, SK-DOS, CCF - \$198.00

PASC from S.E. Media - A FLEX9, SK-DOS Compiler with a definite Pascal "flavor". Anyone with a bit of Pascal experience should be able to begin using PASC to good effect in short order. The PASC package comes complete with three sample programs: ED (a syntax or structure editor), EDITOR (a simple, public domain, screen editor) and CHESS (a simple chess program). The PASC package comes complete with source (written in PASC) and documentation.

FLEX, SK-DOS \$95.00

WHIMSICAL from S.E. Media Now supports Real Numbers. "Structured Programming" WITHOUT losing the Speed and Control of Assembly Language! Single-pass Compiler features unified, user-defined I/O; produces ROMable Code; Procedures and Modules (including pre-compiled Modules); many "Types" up to 32 bit Integers, 6-digit Real Numbers, unlimited sized Arrays (vectors only); Interrupt handling; long Variable Names; Variable Initialization; Include directive; Conditional compiling; direct Code insertion; control of the Stack Pointer; etc. Run-Time subroutines inserted as called during compilation. Normally produces 10% less code than PL/9.

FLEX, SK-DOS and CCF - \$195.00

KANSAS CITY BASIC from S.E. Media - Basic for Color Computer OS-9 with many new commands and sub-functions added. A full implementation of the IF-THEN-ELSE logic is included, allowing nesting to 255 levels. Strings are supported and a subset of the usual string functions such as LEFTS, RIGHTS, MIDS, STRINGS, etc. are included. Variables are dynamically allocated. Also included are additional features such as Peek and Poke. A must for any Color Computer user running OS-9.

CoCo OS-9 \$39.95

C Compiler from Windrush Micro Systems by James McCosh. Full C for FLEX, SK-DOS except bit-fields, including an Assembler. Requires the TSC Relocating Assembler if user desires to implement his own Libraries.

FLEX, SK-DOS, CCF - \$295.00

C Compiler from Introl -- Full C except Doubles and Bit Fields, streamlined for the 6809. Reliable Compiler; FAST, efficient Code. More UNIX Compatible than most.

FLEX, SK-DOS, CCF, OS-9 (Level II ONLY), UniFLEX - \$575.00

PASCAL Compiler from Lucidata -- ISO Based P-Code Compiler.

Designed especially for Microcomputer Systems. Allows linkage to Assembler Code for maximum flexibility.

FLEX, SK-DOS and CCF - \$190.00

OmegaSoft PASCAL from Certified Software -- Extended Pascal for systems and real-time programming.

Native 68000/68020 Compiler, \$575 for base package, options available.

For OS-9/68000 and PDOS host system.

6809 Cross Compiler (OS-9/68000 host) \$700 for complete package.

KBASIC - from S.E. MEDIA -- A "Native Code" BASIC Compiler which is now Fully TSC X BASIC compatible. The compiler compiles to Assembly Language Source Code. A NEW, streamlined, Assembler is now included allowing the assembly of LARGE Compiled K-BASIC Programs. Conditional assembly reduces Run-time package.

FLEX, SK-DOS, CCF, OS-9 Compiler/Assembler \$99.00

CRUNCH COBOL from S.E. MEDIA -- Supports large subset of ANSI Level 1 COBOL with many of the useful Level 2 features. Full FLEX, SK-DOS File Structures, including Random Files and the ability to process Keyed Files. Segment and link large programs at runtime, or implemented as a set of overlays. The System requires 56K and CAN be run with a single Disk System. A very popular product.

FLEX, SK-DOS, CCF - \$99.95

FORTH from Stearns Electronics -- A CoCo FORTH Programming Language. Tailored to the CoCo! Supplied on Tape, transferable to disk. Written in FAST ML. Many CoCo functions (Graphics, Sound, etc.). Includes an Editor, Trace, etc. Provides CPU Carry Flag accessibility, Fast Task Multiplexing, Clean Interrupt Handling, etc. for the "Pro". Excellent "Learning" tool!

Color Computer ONLY - \$58.95

FORTHBUILDER is a stand-alone target compiler (crosscompiler) for producing custom FORTH systems and application programs. All of the 83-standard defining words and control structures are recognized by FORTHBUILDER.

FORTHBUILDER is designed to behave as much as possible like a resident FORTH interpreter/compiler, so that most of the established techniques for writing FORTH code can be used without change.

Like compilers for other languages, FORTHBUILDER can operate in "batch mode".

The compiler recognizes and emulates target names defined by CONSTANT or VARIABLE and is readily extended with "compile-time" definitions to emulate specific target words.

FORTHBUILDER is supplied as an executable command file configured for a specific host system and target processor. Object code produced from the accompanying model source code is royalty-free to licensed users.

FLEX, CCF, SK-DOS - \$99.95

EDITORS & WORD PROCESSING

JUST from S.E. Media -- Text Formatter developed by Ron Anderson; for Dot Matrix Printers, provides many unique features. Output "Formatted" Text to the Display. Use the IPRINT.COM supplied for producing multiple copies of the "Formatted" Text on the Printer INCLUDING IMBEDDED PRINTER COMMANDS (very useful at other times also, and worth the price of the program by itself). "User Configurable" for adapting to other Printers (comes set up for Epson MX-80 with Grafix); up to ten (10) imbedded "Printer Control Commands". Compensates for a "Double Width" printed line. Includes the normal line width, margin, indent, paragraph, space, vertical skip lines, page length, page numbering, centering, fill, justification, etc. Use with PAT or any other editor.

* Now supplied as a two disk set:

Disk #1: JUST2.COM object file,

JUST2.TXT PL9 source; FLEX, SK-DOS, CCF

Disk #2: JUSTSC object and source in C;

FLEX, SK-DOS, OS-9, CCF

The JTSC and regular JUST C source are two separate programs. JTSC compiles to a version that expects TSC Word Processor type commands, (.pp .sp .ce etc.) Great for your older text files. The C

OS-9 68K000 complete with Source - \$79.95

PAT from S.E. Media - A full feature screen oriented TEXT EDITOR with all the best of "PIE™". For those who swore by and loved only PIE, this is for you! All PIE features and much more! Too many features to list. And if you don't like these, change or add your own. PL-9 source furnished. "C" source available soon. Easily configured to your CRT, with special config section.

Regular FLEX, SK-DOS \$129.50

* SPECIAL INTRODUCTION OFFER * \$79.95

SPECIAL PATJUST COMBO (with source)

FLEX, SK-DOS \$99.95

OS-9 68K Version \$229.00

SPECIAL PATJUST COMBO 68K \$249.00

Note: JUST in "C" source available for OS-9

CEDRIC from S.E. Media - A screen oriented TEXT EDITOR with availability of 'MENU' aid. Macro definitions, configurable 'permanent definable MACROS' - all standard features and the fastest 'global' functions in the west. A simple, automatic terminal config program makes this a real 'no hassle' product. Only 6K in size, leaving the average system over 165 sectors for text buffer - approx. 14,000 plus of free memory! Extra fine for programming as well as text.

FLEX, SK-DOS \$69.95

BAS-EDIT from S.E. Media - A TSC BASIC or XBASIC screen editor.

Appended to BASIC or XBASIC, BAS-EDIT is transparent to normal BASIC/XBASIC operation. Allows editing while in BASIC/XBASIC. Supports the following functions: OVERLAY, INSERT and DUP LINE. Make editing BASIC/XBASIC programs SIMPLE! A GREAT time and effort saver. Programmers love it! NO more retyping entire lines, etc. Complete with over 25 different CRT terminal configuration overlays.

FLEX, CCF, SK-DOS \$39.95

SCREDITOR III from Windrush Micro Systems -- Powerful Screen-Oriented Editor/Word Processor. Almost 50 different commands; over 300 pages of Documentation with Tutorial. Features Multi-Column display and editing, "decimal align" columns (AND add them up automatically), multiple keystroke macros, even/odd page headers and footers, imbedded printer control codes, all justifications, "help" support, store common command series on disk, etc. Use supplied "set-ups", or remap the keyboard to your needs. Except for proportional printing, this package will DO IT ALL!

6800 or 6809 FLEX, SK-DOS or SSB-DOS, OS-9 - \$175.00

SPELLB "Computer Dictionary" from S.E. Media -- OVER 150,000 words! Look up a word from within your Editor or Word Processor (with the SPH.CMD Utility which operates in the FLEX, SK-DOS UCS). Or check and update the Text after entry: ADD WORDS to the Dictionary, "Flag" questionable words in the Text, "View a word in context" before changing or ignoring, etc. SPELLB first checks a "Common Word Dictionary", then the normal Dictionary, then a "Personal Word List", and finally, any "Special Word List" you may have specified. SPELLB also allows the use of Small Disk Storage systems.

FLEX, SK-DOS and CCF - \$129.95

STYLO-GRAPH from Great Plains Computer Co. -- A full-screen oriented WORD PROCESSOR -- (uses the 51 x 24 Display Screens on CoCo FLEX/SK-DOS, or PBJ Wordpak). Full screen display and editing; supports the Daisy Wheel proportional printers.

NEW PRICES 6809 CCF and CCO - \$99.95,

FLEX, SK-DOS or OS-9 - \$179.95, UniFLEX - \$299.95

STYLO-SPELL from Great Plains Computer Co. -- Fast Computer Dictionary. Complements Stylograph.

NEW PRICES 6809 CCF and CCO - \$69.95,

FLEX, SK-DOS or OS-9 - \$99.95, UniFLEX - \$149.95

STYLO-MERGE from Great Plains Computer Co. -- Merge Mailing List to "Form" Letters, Print multiple Files, etc., through Stylo.

NEW PRICES 6809 CCF and CCO - \$59.95,

FLEX, SK-DOS or OS-9 - \$79.95, UniFLEX - \$129.95

STYLO-PAK --- Graph + Spell + Merge Package Deal!!!

FLEX, SK-DOS or OS-9 - \$329.95, UniFLEX - \$549.95

OS-9 68000 \$695.00

DATABASE ACCOUNTING

XDMS from Westchester Applied Business Systems

FOR 6809 FLEX or SK-DOS (5/8")

Up to 32 groups/fields per record! Up to 12 character file names! Up to 1024 byte records! User defined screen and print control! Process files! Form files! Conditional execution! Process chaining! Upward/Downward file linking! File joining! Random file virtual paging! Built in utilities! Built in text line editor! Fully session oriented! Enhanced forms! Boldface, Double width, Italics and Underline supported! Written in compact structured assembler! Integrated for FAST execution!

XDMS-IV Data Management System

XDMS-IV is a brand new approach to data management. It not only permits users to describe, enter and retrieve data, but also to process entire files producing customized reports, screen displays and file output. Processing can consist of any of a set of standard high level functions including record and field selection, sorting and aggregation, lookups in other files, special processing of record subsets, custom report formatting, totaling and subtotaling, and presentation of up to three related files as a "database" on user defined output reports.

POWERFUL COMMANDS!

XDMS-IV combines the functionality of many popular DBMS software systems with a new easy to use command set into a single integrated package. We've included many new features and commands including a set of general file utilities. The processing commands are Input-Process-Output (IPO) which allows almost instant implementation of a process design.

SESSION ORIENTED!

XDMS-IV is session oriented. Enter "XDMS" and you are in instant command of all the features. No more waiting for a command to load in from disk! Many commands are immediate, such as CREATE (file definition), UPDATE (file editor), PURGE and DELETE (utilities). Others are process commands which are used to create a user process which is executed with a RUN command. Either may be entered into a "process" file which is executed by an EXECUTE statement. Processes may execute other processes, or themselves, either conditionally or unconditionally. Menus and screen prompts are easily coded, and entire user applications can be run without ever leaving XDMS-IV.

IT'S EASY TO USE!

XDMSIV keeps data management simple! Rather than design a complex DBMS which hides the true nature of the data, we kept XDMS-IV file oriented. The user view of data relationships is presented in reports and screen output, while the actual data resides in easy to maintain files. This aspect permits customized presentation and reports without complex redefinition of the database files and structure. XDMS-IV may be used for a wide range of applications from simple record management systems (addresses, inventory ...) to integrated database systems (order entry, accounting...)

The possibilities are unlimited...

FOR 6809 FLEX or SK-DOS(5"/8" Disk) \$249.95

UTILITIES

Basic09 XRef from S.E. Media -- This Basic09 Cross Reference Utility is a Basic09 Program which will produce a "pretty printed" listing with each line numbered, followed by a complete cross referenced listing of all variables, external procedures, and line numbers called. Also includes a Program List Utility which outputs a fast "pretty printed" listing with line numbers. Requires Basic09 or RunB.

OS-9 & CCO object only -- \$39.95; with Source - \$79.95

BTree Routines - Complete set of routines to allow simple implementation of keyed files - for your programs - running under Basic09. A real time saver and should be a part of every serious programmers tool-box.

OS-9 & CCO object only - \$89.95

Lucidata PASCAL UTILITIES (Requires Pascal ver 3)

XREF -- produce a Cross Reference Listing of any text; oriented to Pascal Source.

INCLUDE -- Include other Files in a Source Text, including Binary - unlimited nesting.

PROFILER -- provides an Indented, Numbered, "Structogram" of a Pascal Source Text File; view the overall structure of large programs, program integrity, etc. Supplied in Pascal Source Code; requires compilation.

FLEX, SK-DOS, CCF ... EACH 5" - \$40.00, 8" - \$50.00

DUB from S.E. Media -- A UniFLEX BASIC decompiler Re-Create a Source Listing from UniFLEX Compiled basic Programs. Works with ALL Versions of 6809 UniFLEX basic.

UniFLEX - \$219.95

LOW COST PROGRAM KITS from Southeast Media The following kits are available for FLEX, SK-DOS on either 5" or 8" Disk.

1. BASIC TOOL-CHEST \$29.95

BLISTER.CMD: pretty printer

LINXREF.BAS: line cross-referencer

REMPAC.BAS, SPCPAC.BAS, COMPACBAS:

remove superfluous code

STRIP.BAS: superfluous line-numbers stripper

2. FLEX, SK-DOS UTILITIES KIT \$39.99

CATS. CMD: alphabetically-sorted directory listing

CATD.CMD: date-sorted directory listing

COPYSORT.CMD: file copy, alphabetically

COPYDATE.CMD: file copy, by date-order

FILEDATE.CMD: change file creation date

INFO.CMD (& INFOGMX.CMD): tells disk attributes & contents

RELINK.CMD (& RELINK82): re-orders fragmented free chain

RESQ.CMD: undeletes (recovers) a deleted file

SECTORS.CMD: show sector order in free chain

XL.CMD: super text lister

3. ASSEMBLERS/DISASSEMBLERS UTILITIES \$39.95

LINEFEED.CMD: 'modularise' disassembler output
MATH.CMD: decimal, hex, binary, octal conversions & tables

SKIP.CMD: column stripper

4. WORD - PROCESSOR SUPPORT UTILITIES \$49.95

FULLSTOP.CMD: checks for capitalization

8STYCT.BAS (.BAC): Stylo to dot-matrix printer

NECPINT.CMD: Stylo to dot-matrix printer filter code

5. UTILITIES FOR INDEXING \$49.95

MENU.BAS: selects required program from list below

INDEX.BAC: word index

PHRASES.BAC: phrase index

CONTENT.BAC: table of contents

INDXSORT.BAC: fast alphabetic sort routine

FORMATER.BAC: produces a 2-column formatted index

APPEND.BAC: append any number of files

CHAR.BIN: line reader

BASIC09 TOOLS consist of 21 subroutines for Basic09.

6 were written in C language and the remainder in assembly.

All the routines are compiled down to native machine code which makes them fast and compact.

1. **CFILL** -- fills a string with characters

2. **DPEEK** -- Double peek

3. **DPOKE** -- Double poke

4. **FPOS** -- Current file position

5. **FSize** -- File size

6. **FTRIM** -- removes leading spaces from a string

7. **GETPR** -- returns the current process ID

8. **GETOPT** -- gets 32 byte option section

9. **GETUSR** -- gets the user ID

10. **GTIME** -- gets the time

11. **INSERT** -- insert a string into another

12. **LOWER** -- converts a string into lowercase

13. **READY** -- Checks for available input

14. **SETPRIOR** -- changes a process priority

15. **SETUSR** -- changes the user ID

16. **SETOPT** -- set 32 byte option packet

17. **STIME** -- sets the time

18. **SPACE** -- adds spaces to a string

19. **SWAP** -- swaps any two variables

20. **SYSCALL** -- system call

21. **UPPER** -- converts a string to uppercase

For OS-9 - \$44.95 - Includes Source Code

SOFTTOOLS

The following programs are included in object form for immediate application. PL/9 source code available for customization.

READ-ME Complete instructions for initial set-up and operation. Can even be printed out with the included text processor.

CONFIG one time system configuration.

CHANGE changes words, characters, etc. globally to any text type file.

CLEANTXT converts text files to standard FLEX, SK-DOS files.

COMMON compare two text files and reports differences.

COMPARE another check file that reports mis-matched lines.

CONCAT similar to FLEX, SK-DOS append but can also list files to screen.

DOCUMENT for PL/9 source files. Very useful in examining parameter passing aspects of procedures.

Fax: (615) 842-7990

ECHO echos to either screen or file.

FIND an improved find command with "pattern" matching and wildcards. Very useful.

HEX dumps files in both hex and ASCII.

INCLUDE a file copy program that will accept "includes" of other disk files.

KWIC allows rotating each word, on each line to the beginning. Very useful in a sort program, etc.

LISTDIR a directory listing program. Not super, but better than CAT.

MEMSORT a high-speed text file sorter. Up to 10 fields may be sorted. Very fast. Very useful.

MULTICOL width of page, number of columns may be specified. A MUST!

PAGE similar to LIST but allows for a page header, page width and depth. Adjust for CRT screen or printer as set up by CONFIG. A very smart print driver. Allows printer control commands.

REMOVE a fast file deleter. Careful, no prompts issued. Zap, and its gone! SCREEN a screen listing utility. Word wraps text to fit screen. Screen depth may be altered at run time.

SORT a super version of MEMSORT. Ascending/descending order, up to 10 keys, case over-ride, sort on nth word and sort on characters if file is small enough, sorts in RAM. If large file, sort is constrained to size of your largest disk capacity.

TPROC a small but nice text formatter. This is a complete formatter and has functions not found in other formatters.

TRANSLIT sorts a file by x keyfields. Checks for duplications. Up to 10 key files may be used.

UNROTATE used with KWIC this program reads an input file and unfolds it a line at a time. If the file has been sorted each word will be presented in sequence.

WC a word count utility. Can count words, characters or lines.

NOTE: this set of utilities consists of 6 5-1/4" disks or 2 8" disks, with source (PL9). 3 5-1/4" disks or 1 8" disk without source.

Complete set SPECIAL INTRO PRICE:

5-1/4" with source FLEX or SK-DOS - \$129.95

without source - \$79.95

8" with source - \$79.95 - without source \$49.95

FULL SCREEN FORMS DISPLAY from Computer Systems Consultants - TSC Extended BASIC program supports any Serial Terminal with Cursor Control or Memory-Mapped Video Displays; substantially extends the capabilities of the Program Designer by providing a table-driven method of describing and using Full Screen Displays.

FLEX, SK-DOS and CCF, UniFLEX - \$25.00, with Source - \$50.00

SOLVE from S.E. Media - OS-9 Levels I and II only. A Symbolic Object/Logic Verification & Examine debugger. Including inline debugging, disassemble and assemble. SOLVE IS THE MOST COMPLETE DEBUGGER we have seen for the 6809 OS-9 series! SOLVE does it all! With a rich selection of monitor, assembler, disassembler, environmental, execution and other miscellaneous commands, SOLVE is the MOST POWERFUL tool-kit item you can own! Yes, SOLVE is simple to use! With complete documentation, a snap! Everyone who has ordered this package has raved! See review - 68 Micro Journal - December 1985. No 'blind' debugging here, full screen displays, rich and complete in information presented. Since review in 68 Micro Journal, this is our fastest mover!

Levels I & II only - OS-9 \$69.95

DISK UTILITIES

OS-9 VDisk from S.E. Media -- For Level I only. Use the Extended Memory capability of your SWTPC or Gunix CPU card (or similar format DA'T) for FAST Program Compiles, CMD execution, high speed inter-process communications (without pipe buffers), etc. - SAVE that System Memory. Virtual Disk size is variable in 4K increments up to 960K. Some Assembly Required.

Level I OS-9 object \$79.95; with Source \$149.95

O-F from S.E. Media -- Written in BASIC09 (with Source), includes:

REFORMAT, a BASIC09 Program that reformats a chosen amount of an OS-9 disk to FLEX, SK-DOS Format so it can be used normally by FLEX, SK-DOS; and FLEX, a BASIC09 Program that does the actual read or write function to the special O-F Transfer Disk; user-friendly menu driven. Read the FLEX, SK-DOS Directory, Delete FLEX, SK-DOS Files, Copy both directions, etc. FLEX, SK-DOS users use the special disk just like any other FLEX, SK-DOS disk

OS-9 - 6809/68000 \$79.95

LSORT from S.E. Media - A SORT/MERGE package for OS-9 (Level I & II only). Sorts records with fixed lengths or variable lengths. Allows for either ascending or descending sort. Sorting can be done in either ASCII sequence or alternate collating sequence. Right, left or no justification of data fields available. LSORT includes a full set of comments and errors messages.

OS-9 \$85.00

HIER from S.E. Media - HIER is a modern hierarchical storage system for users under FLEX, SK-DOS. It answers the needs of those who have hard disk capabilities on their systems, or many files on one disk - any size. Using HIER a regular (any) FLEX, SK-DOS disk (8 - 5" hard disk) can have sub directories. By this method the problems of assigning unique names to files is less burdensome. Different files with the exact same name may be on the same disk, as long as they are in different directories. For the winchester user this becomes a must. Sub-directories are the modern day solution that all current large systems use. Each directory looks to FLEX, SK-DOS like a regular file, except they have the extension '.DIR'. A full set of directory handling programs are included, making the operation of HIER simple and straightforward. A special install package is included to install HIER to your particular version of FLEX, SK-DOS. Some assembly required. Install indicates each byte or reference change needed. Typically - 6 byte changes in source (furnished) and one assembly of HIER is all that is required. No programming required!

FLEX - SK-DOS \$79.95

COPYMULT from S.E. Media -- Copy LARGE Disks to several smaller disks. FLEX, SK-DOS utilities allow the backup of ANY size disk to any SMALLER size diskettes (Hard Disk to Floppies, 8" to 5", etc.) by simply inserting diskettes as requested by COPYMULT. No fooling with directory deletions, etc. COPYMULT.CMD understands normal "copy" syntax and keeps up with files copied by maintaining directories for both host and receiving disk system. Also includes BACKUP.CMD to download any size "random" type file; RESTORE.CMD to restructure copied "random" files for copying, or recopying back to the host system; and FREELINK.CMD as a "bonus" utility that "relinks" the free chain of floppy or hard disk, eliminating fragmentation.

Completely documented Assembly Language Source files included. ALL 4 Programs (FLEX, SK-DOS, 8" or 5") \$99.50

COPYCAT from Lucidata -- *Pascal NOT required*. Allows reading TSC Mini-FLEX, SK-DOS, SSB-DOS68, and Digital Research CP/M Disks while operating under SK-DOS, FLEX1.0, FLEX 2.0, or FLEX 9.0 with 6800 or 6809 Systems. COPYCAT will not perform miracles, but, between the program and the manual, you stand a good chance of accomplishing a transfer. Also includes some Utilities to help out. Programs supplied in Modular Source Code (Assembly Language) to help solve unusual problems.

FLEX, SK-DOS and CCF 5" - \$50.00 FLEX, SK-DOS 8" - \$65.00

VIRTUAL TERMINAL from S.E. Media - Allows one terminal to do the work of several. The user may start as many as eight tasks on one terminal, under *VIRTUAL TERMINAL*, and switch back and forth between tasks at will. No need to exit each one; just jump back and forth. Complete with configuration program. The best way to keep up with those background programs.

6809 OS-9 & CCO - object only - \$49.95

FLEX, SK-DOS DISK UTILITIES from Computer Systems Consultants -- Eight (8) different Assembly Language (with Source Code) FLEX, SK-DOS Utilities for every FLEX, SK-DOS Users Toolbox: Copy a File with CRC Errors; Test Disk for errors; Compare two Disks; a fast Disk Backup Program; Edit Disk Sectors; Linearize Free-Chain on the Disk; print Disk Identification; and Sort and Replace the Disk Directory (in sorted order). -- PLUS -- Ten X BASIC Programs including: A BASIC Resequencer with EXTRAS over "RENUM" like check for missing label definitions, processes Disk to Disk instead of in Memory, etc. Other programs Compare, Merge, or Generate Updates between two BASIC Programs, check BASIC Sequence Numbers, compare two unsequenced files, and 5 Programs for establishing a Master Directory of several Disks, and sorting, selecting, updating, and printing paginated listings of these files. A BASIC Cross-Reference Program, written in Assembly Language, which provides an X-Ref Listing of the Variables and Reserved Words in TSC BASIC, X BASIC, and PRECOMPILER BASIC Programs.

ALL Utilities include Source (either BASIC or A.L. Source Code).

FLEX, SK-DOS and CCF - \$50.00

BASIC Utilities ONLY for UniFLEX -- \$30.00

MS-DOS to FLEX Transfer Utilities to OS-9 For 68XXX and CCOS-9 Systems Now READ - WRITE - DIR - DUMP - EXPLORE FLEX & MS-DOS Disk. These Utilities come with a rich set of options allowing the transfer of text type files from/to FLEX & MS-DOS disks. *CoCo systems require the D.P. Johnson SDISK utilities and OS-9 and two drives of which one must be a "host" floppy.

**CoCo Version: \$69.95*

68XXX Version \$99.95

MISCELLANEOUS

TABULA RASA SPREADSHEET from Computer Systems Consultants --

TABULA RASA is similar to DESKTOP/PLAN; provides use of tabular computation schemes used for analysis of business, sales, and economic conditions. Menu-driven; extensive report-generation capabilities. Requires TSC's Extended BASIC.

FLEX, SK-DOS and CCF, UniFLEX - \$50.00, with Source - \$100.00

DYNACALC -- Electronic Spread Sheet for the 6809 and 68000.

UniFLEX - \$395.00. FLEX, SK-DOS, OS-9 and SPECIAL CCF - \$250.00

OS-9 68K - \$299.00

FULL SCREEN INVENTORY/MRP from Computer Systems Consultants

Use the Full Screen Inventory System/Materials Requirement Planning for maintaining inventories. Keeps item field file in alphabetical order for easier inquiry. Locate and/or print records matching partial or complete item, description, vendor, or attributes; find backorder or below stock levels. Print-outs in item or vendor order. MRP capability for the maintenance and analysis of Hierarchical assemblies of items in the inventory file. Requires TSC's Extended BASIC.

FLEX, SK-DOS and CCF, UniFLEX - \$50.00, with Source - \$100.00

FULL SCREEN MAILING LIST from Computer Systems Consultants --

The Full Screen Mailing List System provides a means of maintaining simple mailing lists. Locate all records matching on partial or complete name, city, state, zip, or attributes for Listings or Labels, etc. Requires TSC's Extended BASIC.

FLEX, SK-DOS and CCF, UniFLEX - \$50.00, with Source - \$100.00

DIET-TRAC Forecaster from S.E. Media -- An X BASIC program that plans a diet in terms of either calories and percentage of carbohydrates, proteins and fats (C P U%) or grams of Carbohydrate. Protein and Fat food exchanges of each of the six basic food groups (vegetable, bread, meat, skim milk, fruit and fat) for a specific individual. Sex, Age, Height, Present Weight, Frame Size, Activity Level and Basal Metabolic Rate for normal individual are taken into account. Ideal weight and sustaining calories for any weight of the above individual are calculated. Provides number of days and daily calendar after weight goal and caloric plan is determined.

FLEX, SK-DOS - \$59.95, UniFLEX - \$89.95

GAMES

RAPIER - 6809 Chess Program from S.E. Media -- Requires FLEX, SK-DOS and Displays on Any Type Terminal. Features: Four levels of play. Swap side. Point scoring system. Two display boards. Change skill level. Solve Checkmate problems in 1-2-3-4 moves. Make move and swap sides. Play white or black. This is one of the strongest CHESS programs running on any microcomputer, estimated USCF Rating 1600+ (better than most 'club' players at higher levels)

FLEX, SK-DOS and CCF - \$79.95

NEW

MS-DOS/FLEX Transfer Utilities For 68XXX and CoCo* OS-9 Systems. Now Read, Write, DIR, Dump and Explore FLEX & MS-DOS Disks. Supplied with a rich set of options to explore and transfer text type files from/to FLEX and MS-DOS disks. *CoCo OS-9 requires SDISK utilities & two floppy drives.

CCO \$69.95 68XXX OS-9 \$99.95

MS-DOS and Macintosh Software at Discounted Prices

"Call for prices, it'll be worth the savings."

FLEX 6809 DIAGNOSTICS Disk Drive Test

ROM Test, RAM Test

INTRODUCTION

The following utilities are available on 68 Micro Journal Reader Service Disk #34. However, they are being published here as well because of the sharing spirit of the author:

Emery Korpi
40 Beatrice Ave.
Syosset, NY, 11791.

I, and thousands of loyal readers thank you Emery for your willingness to share your efforts with all of us. It is that type of spirit that has allowed us to survive. As a contributor supported magazine we urge all our readers to do likewise. If so, we will be around a long time to come.
Again, thanks - Emery!

DMW

DISC DRIVE TEST (DDT) NOTES:

INTRODUCTION -

THIS PROGRAM HAS BEEN WRITTEN TO AID IN THE ALIGNMENT OF 5 INCH* DISK DRIVES UNDER THE FLEX OP-SYSTEM. IT ALLOWS FOR TESTING OF DRIVES 0 THROUGH 3 WITH THE WD179X SERIES OF DISK CONTROLLERS IN ANY OF THE SYSTEM I/O SLOTS. THE PROGRAM MAY BE USED WITH EITHER 1MHZ OR 2MHZ CLOCKED SYSTEMS AND IS COMPATIBLE WITH DC-1 TO DC-4 OR FD-2 CONTROLLERS THIS PROGRAM HAS THE FOLLOWING TEST CAPABILITIES.

1. DRIVE READY SIGNAL RESPONSE TIME
2. HEAD LOAD DELAY TIME
3. BUSY SIGNAL RESPONSE TIME
4. DRIVE ROTATIONAL SPEED TEST
5. INDEX PULSE WIDTH TEST
6. TRACK 0 SWITCH ADJUSTMENT
7. DRIVE STEP TIME
8. TEST OF ALL DISK SECTORS
9. RADIAL ALIGNMENT
10. READ/WRITE/MODIFYING DATA ON ANY SECTOR.

THIS PROGRAM ALSO CAN OPERATE WITH THE DYSAN DIGITAL DIAGNOSTIC DISKS IN ORDER TO FIND:

1. RADIAL TRACK ALIGNMENT ERRORS (IN MILLI-INCHES)
2. STEPPER MOTOR ACCURACY AND REPEATABILITY PROBLEMS
3. REDUCED AMPLITUDE SIGNAL PROBLEMS
4. AZIMUTHAL HEAD ALIGNMENT ERRORS

A. STARTING THE PROGRAM -

THE PROGRAM MAY BE STARTED IN EITHER OF THREE WAYS. THESE ARE;

1. DDT - THE OPERATOR WILL BE PROMPTED FOR THE DRIVE NUMBER (0-3), THE SYSTEM CLOCK SPEED (1 OR 2 MHZ) AND THE I/O SLOT THAT THE CONTROLLER IS INSTALLED IN.

2. DDT,# - THE PROGRAM WILL TEST DRIVE NO '#' AND ASSUMES A 1 MHZ CLOCK RATE AND I/O SLOT ONE. THESE DEFAULT VALUES MAY BE CHANGED IN THE SOURCE PROGRAM WHICH IS SUPPLIED.

3. DDT,>file - THE PROGRAM WILL BE PROMPTED THE SAME AS IN DDT AND A COPY OF ALL TERMINAL DATA WILL BE WRITTEN INTO TEXT FILE file.

B. TEST OPTIONS -

THE OPERATOR OF THIS PROGRAM HAS THE OPTION OF HALTING AFTER EACH TEST. IF THIS OPTION IS NOT TAKEN, THE PROGRAM WILL PROCEED AUTOMATICALLY UNTIL A FAILURE OR KEYBOARD ENTRY IS ENCOUNTERED; AT WHICH POINT IT WILL HALT. THE PROGRAM WILL THEN GIVE THE OPERATOR THE FOLLOWING OPTIONS:

1. RETRY - ENTERING '1' WILL CAUSE THE PROGRAM TO RE-EXECUTE THE CURRENT TEST
2. CONTINUE - ENTERING '2' WILL CAUSE THE PROGRAM TO CONTINUE TO THE NEXT TEST
3. EXIT - ENTERING '3' WILL CAUSE A RETURN TO THE OP-SYSTEM

C. DISK DRIVE TESTING PRINTOUT FORMAT

- I. DRIVE MOTOR STATUS (E0X8)
A. READY RESPONSE TIME = XXXX.XX MSEC
B. BUSY RESPONSE TIME = XX USEC

C. HEAD LOAD DELAY TIME = XXXX.XX MSEC
D. WRITE PROTECT = Y/N
E. INDEX PULSE COUNT = XX S/B GT 2

THESE TESTS ARE PERFORMED BY READING THE DISK CONTROLLER STATUS WHICH IS FOUND AT MEMORY LOCATION E0X8.

- READY RESPONSE TIME IS THE TIME THAT THE READY SIGNAL TAKES TO GO HI. IT IS THE TIME REQUIRED FOR THE DRIVE MOTOR TO REACH ITS DESIGNATED SPEED.
- BUSY RESPONSE TIME IS THE TIME NECESSARY FOR THE CONTROLLER TO DIGEST AN INSTRUCTION AND INDICATE IT IS BUSY.
- HEAD LOAD DELAY TIME IS THE TIME ALLOTTED FOR THE HEAD TO LOAD BEFORE READING OR WRITING CAN PROCEED.
- WRITE PROTECT INDICATES IF THE DISK IS WRITE PROTECTED.
- INDEX PULSE COUNT COUNTS THE NUMBER OF INDEX PULSES WHICH OCCUR IN THE ALLOTTED TIME SPAN. FAILURE INDICATES NO DISK IN DRIVE, MOTOR FAILURE OR CLUTCH FAILURE.

II. DRIVE SPEED TEST

PERIOD = XXXX.XX MSEC S/B 200 +/- 1 MSEC

THIS TEST MEASURES THE ROTATIONAL SPEED OF THE DISK BY MEASURING THE TIME PERIOD OF THE INDEX PULSE. MISADJUSTMENT IS A COMMON CAUSE OF SOFT DISK ERRORS. THE SPEED MAY BE ADJUSTED AND CHECKED WITH THE 'RETRY' OPTION.

III. INDEX PULSE WIDTH

WIDTH = XXXX.XX MSEC S/B 2.5-5.5 MSEC

THIS IS THE PULSE WIDTH OF THE SIGNAL GENERATED WHEN THE INDEX HOLE PASSES IN FRONT OF THE INDEX DETECTOR CIRCUITRY OF THE DRIVE.

IV. TRACK 0 SWITCH TEST

- A. STEP TIME FROM TRACK 0 TO SWITCH = XXXX.XX
- B. STEP TIME FROM TRACK 1 TO SWITCH = XXXX.XX
- C. SWITCHPOINT(A/A+B) = XX% S/B 5% TO 95%

THIS TEST VERIFIES THE POSITION OF THE TRACK 0 MICRO-SWITCH IS CORRECTLY ADJUSTED. THE 'TRACK 0' SIGNAL STOPS THE CONTROLLER FROM STEPPING WHEN A RESTORE TO TRACK 0 COMMAND IS ISSUED.

THIS TEST DETERMINES THE TRACK 0 SWITCHPOINT POSITION BY TIMING MEASUREMENTS. TIME MEASUREMENTS ARE MADE STARTING FROM THE STEP COMMAND UNTIL THE SWITCH TOGGLES WHEN:

- A. STEPPING FROM TRACK 0 TO 1 AND
- B. STEPPING FROM TRACK 1 TO 0.

THE SWITCHPOINT IS THE RATIO OF ONE MEASUREMENT TO THE SUM OF THE MEASUREMENTS (IE A/A+B).

FOR DRIVES USING PHOTO DIODE POSITION DETECTOR SWITCHES, THIS TIMING TEST METHOD ACCURATELY REFLECTS THE PHYSICAL SWITCHPOINT POSITION. MEASUREMENTS OF 40-60% ARE TYPICAL FOR THIS TYPE OF DRIVE.

FOR DRIVES WITH A MECHANICAL SWITCH, THE MEASUREMENT IS INFLUENCED BY SWITCH SPRING TENSION. TYPICAL MEASUREMENTS OF 5-20% MAY BE

OBTAINED WITH A PHYSICAL SWITCHPOINT MIDWAY BETWEEN TRACKS 0 AND 1.

V. STEP RATE TEST

TRACK STEP TIME = XX.XX MSEC S/B LT 40 MSEC

THIS TEST FINDS THE DRIVE STEP TIME. THIS IS THE SMALLEST TIME NECESSARY FOR THE DRIVE TO STEP FROM ONE TRACK TO THE NEXT.

THIS TEST IS PERFORMED BY STEPPING BETWEEN TRACKS 32 AND 0 AT DIFFERENT RATES. THE RATE IS CONSIDERED TO BE SUCCESSFUL IF THE TRACK 0 SWITCH HAS BEEN SET. THE STEP RATE IS FOUND BY A NINTH ORDER BINARY SEARCH AS FOLLOWS:

```
TIME:=DELTA:=20.48MSEC
FOR I = 1 THRU 9
  DELTA := DELTA/2
  IF SUCCESSFUL THEN
    TIME := TIME - DELTA
  ELSE
    TIME := TIME + DELTA
  END IF
END FOR
```

THIS TECHNIQUE YIELDS A MEASUREMENT RANGE OF 0 TO 41 MSEC WITH AN ACCURACY OF 0.08 MSEC.

VI. DOUBLE DENSITY STATUS (E0X4)

- A. RESTORE USING INTRQ(D6) GO/NG
- B. READ SECTOR USING DRQ(D7) GO/NG
- C. NO. BYTES READ = XXXX S/B 256 BYTES

SOME SYSTEMS USE THE STATUS WORD AT MEMORY LOCATION E0X4 FOR DISK READ AND WRITE OPERATIONS. THIS TEST CHECKS THE FUNCTIONALITY OF THE TWO SIGNALS ASSOCIATED WITH THIS STATUS WORD.

VII. RADIAL ALIGNMENT TEST

1. CHECK ALL TRACKS
2. ALIGN
3. EXIT
4. CHECK SINGLE TRACK
5. NEXT TEST
6. PRINT SYMBOL TABLE

- CHECK ALL TRACKS OR A SINGLE TRACK PRINTS, FOR EACH SECTOR, AN '*' FOR 256 BYTE SECTORS OR '.' FOR 128 BYTE SECTORS. THE ERROR CODE IS PRINTED FOR A SECTOR WITH AN ERROR. THE ERROR CODES MAY BE PRINTED BY ENTERING OPTION '6'. THE TRACKS ARE TESTED OUT OF ORDER, TO TEST FOR STEPPER MOTOR SKIP AND DIRECTIONAL OFFSETS.

- SECTOR SYMBOL TABLE:

- * 256 BYTE SECTOR OK
- . 128 BYTE SECTOR OK

U 0-127 BYTES READ INTO BUFFER, STATUS OK

B 129-255 BYTES READ INTO BUFFER, STATUS OK

O OVER 256 BYTES READ INTO BUFFER, STATUS OK

T TRACK NO. ERROR, ON WRONG TRACK

N NO DATA ON TRACK OR UNFORMATTED TRACK

S MISSING SECTOR

C ID FIELD CRC ERROR

A ADDRESS MARK ERROR IN DATA FIELD

D DATA FIELD CRC ERROR

- ALIGNMENT MAY BE PERFORMED WITH EITHER: AN OP-SYSTEM DISK (OR DISK FROM ALIGNED DRIVE) OR WITH A DYSAN DIGITAL DIAGNOSTIC DISK.

- USING THE OP-SYSTEM DISK:

1. ADJUST THE STEPPER MOTOR CLOCK WISE UNTIL ABOUT HALF OF THE SECTORS HAVE ERRORS AND MARK THIS POSITION.

2. ADJUST THE STEPPER MOTOR COUNTER CLOCKWISE UNTIL HALF OF THE SECTORS HAVE ERRORS AND MARK THIS POSITION.

3. CENTER THE STEPPER MOTOR BETWEEN THE TWO MARKED POSITIONS.

- USING THE DIGITAL DIAGNOSTIC DISKETTE(DDD)

A. REDUCTION OF SIGNAL STRENGTH TEST

1. 5/12 AMPLITUDE - ALTERNATE SECTORS OFF SET BY 7 MILS
2. 4/12 AMPLITUDE - ALTERNATE SECTORS OFF SET BY 8 MILS
3. 3/12 AMPLITUDE - ALTERNATE SECTORS OFF SET BY 9 MILS

THE HEAD PICKS UP A SIGNAL IN A 12 MIL WIDE TRACK ON THE DISK. ALTERNATE SECTORS ARE DISPLACED BY 7, 8 AND 9 MILS ON TRACKS 21, 24 AND 27 RESPECTIVELY TO PRODUCE AN EFFECTIVE REDUCTION IN SIGNAL STRENGTH. THIS TEST CHECKS FOR WEAK DRIVE ELECTRONICS, HUB CENTERING, STEPPER PLAY, NEED FOR HEAD CLEANING AND MISADJUSTED HEAD LOAD PADS.

B. TRACK OFFSET IN MILLI-INCHES

TRY STEP DIRN=IN STEP DIRN=OUT LIMITS GO/NG

1. +XX.X MILS	+XX.X MILS	+/-1.5	GO
2. +XX.X MILS	+XX.X MILS	+/-1.5	GO
3. +XX.X MILS	+XX.X MILS	+/-1.5	GO
4. +XX.X MILS	+XX.X MILS	+/-1.5	GO
5. +XX.X MILS	+XX.X MILS	+/-1.5	GO

THERE ARE SIX TRACKS AVAILABLE TO TEST RADIAL ALIGNMENT. THESE ARE TRACKS 0, 5, 16, 19, 30 AND 39. THIS TEST CHECKS THE SELECTED TRACK WITH PROGRESSIVE OFFSETS AND CALCULATES THE DISTANCE THE HEAD IS OFF OF CENTER. THIS IS DONE FROM TWO DIRECTIONS IN ORDER TO CHECK FOR HYSTERESIS OR STEP DIRECTION DEPENDENT PLAY. THE MEASUREMENT RANGE IS -6 TO +6 MILS WITH AN ACCURACY OF +/-0.5 MILS.

C. AZIMUTHAL HEAD ANGLE TEST

HEAD ANGLE = XX.X MIN S/B 0 +/- 12 MIN

THE DISK HEAD READS AND WRITES ON THE RADIAL CENTERLINE OF THE TRACK. THIS TEST MEASURES THE SKEW ANGLE OF THE HEAD RELATIVE TO THE TRACK CENTERLINE BY TESTING SECTORS WITH PROGRESSIVE ANGLE OFFSETS ON TRACK NO. 34. MEASUREMENT RANGE IS -18 TO +18 MINUTES WITH AN ACCURACY OF +/-1.5 MINUTES.

VIII. READ/WRITE SECTOR TEST

1. PATTERN 1
2. PATTERN 2
3. MODIFY BUFFER(M)
4. EXIMINE BUFFER(E)
5. READ SECTOR(R)
6. WRITE SECTOR(W)
7. NEXT SECTOR(N)
8. RETURN TO FLEX(F)
9. HELP(H)

- PATTERN 1 INITIALIZES THE BUFFER TO HEXADECIMAL BDBDBD...

- PATTERN 2 INITIALIZES THE BUFFER TO HEXIDECIMAL 242424...

- MODIFY BUFFER ALLOWS EDITING OF THE SECTOR BUFFER USING:

N = NEXT BYTE

L = LAST BYTE

RTN = EXIT MODIFY

- EXIMINE BUFFER PRINTS THE 256 BYTE SECTOR BUFFER IN A HEXIDECIMAL AND ASCII FORMAT

- READ SECTOR READS THE SELECTED SECTOR INTO THE SECTOR BUFFER AND DISPLAYS THE SECTOR BUFFER

- WRITE SECTOR WRITES THE CURRENT CONTENTS OF THE SECTOR BUFFER INTO THE SELECTED SECTOR

- NEXT SECTOR READS THE NEXT SECTOR IN THE FILE CHAIN

- RETURN TO FLEX ENDS THE PROGRAM

- HELP DISPLAYS ALL TEST VIII TEST OPTIONS

*NOTE-SOURCE PROGRAM MODIFICATIONS ARE NECESSARY TO TEST 8 INCH DISK DRIVES.

HCL AMERICA ANNOUNCES 68030-BASED MINICOMPUTER

System Incorporates up to Six 68030 Processors and 68882 Math Coprocessors

AUSTIN, Texas, Feb. 6, 1989 — HCL America (Sunnyvale, Calif.), a subsidiary of India's largest computer manufacturer, today announced a multiprocessor minicomputer based on Motorola's 68030 (O30) processor and 68882 (882) math coprocessor. The system, called M3000 series, uses up to six 25 MHz O30s each coupled with a 25 MHz 882 and is targeted at office automation and on-line transaction processing.

HCL's announcement adds to a growing base of manufacturers offering O30-based products including Apple Computer, Apollo, Hewlett-Packard, NEC and Sony Microsystems. The O30 is the top-of-the-line microprocessor in Motorola's 68000 family that includes the 68000, 68008, 68010 and 68020. The 68000 family has generated the largest software base (\$3 billion) and most established hardware base (\$100 billion). The O30's compatibility with preceding members of the 68000 family protects manufacturers' original software investments by allowing for easy migration of software from one 68000 processor to another.

"The O30's versatility and price/performance advantage make it a natural choice for a wide range of markets," said Murray A. Goldman, senior vice president and general manager of Motorola's Microprocessor Products Group (Austin, Texas). "Our soon-to-be-announced 68040 will be a revolutionary product that supports our large 68000 installed base."

HCL America is a wholly owned subsidiary of HCL Ltd., India's largest computer company and leading supplier of Unix-based machines. HCL America, headquartered in Sunnyvale, Calif., markets Unix-based multiprocessor computer systems and software, as well as customized software services to OEM customers.

Motorola's \$2.2 billion Semiconductor Products Sector (Phoenix, Ariz.), which includes the Microprocessor Products Group (Austin, Texas), is a part of Motorola Inc. It is the largest and broadest supplier of semiconductors in North America, with a balanced portfolio of over 50,000 devices.

Mr. Larry Williams
Executive Editor
68 Micro Journal
Computer Publishing, Inc.
5980 Castaneda Smith Road
Hixson, Tennessee 37343

Dear Sir,

Thanks for letting us know about your journal and please excuse me for not getting back to you. Since your magazine is dedicated to the coverage of Motorola microprocessors, I would expect that your readers will be interested in the enclosed press release regarding our CrossCode C product, which is just now being introduced under the VAX VMS operating system. CrossCode C is an optimizing C compiler that runs on the VAX and generates ROMable code for all members of Motorola's 68000 family of microprocessors.

CrossCode C is used to develop a wide variety of 68000-based applications, including automotive control devices, aerospace and defense products, amusement devices, computer and communications equipment, consumer products, laser scanning equipment, and medical instruments.

CrossCode C allows our customers to develop code for these devices using the VAX, which provides a complete and friendly software development environment. Here's how it works:

The programmer uses all the powerful and familiar tools on the VAX (i.e. terminals, printers, file system, text editor, etc.) to produce C source code for a program that will eventually run on the 68000 based hardware. CrossCode C then compiles this source code into an object file which represents the actual instruction codes to be executed by the 68000. This object file is then converted into a format that is suitable for transmission down a data link to the 68000 hardware, where the object code is executed. In a nutshell, that's how CrossCode C is used.

Is there anything really special about this product introduction? Yes there is. CrossCode C is now one of the very few 68000 C compilers that provides identical capabilities under three different operating system environments: VMS, UNIX, and MS-DOS. Not only that, but it allows users to move their source, object code, and object libraries to different types of machines without having to recompile or relink them. That's because CrossCode C's object files are independent of the machine on which they were generated.

For example, a CrossCode C user can take object files or libraries that were generated on a VAX, move them to a PC or a SUN and then use the PC or SUN as a development machine. People who have networks containing machines that support two or three different operating systems (VMS, UNIX or MS-DOS) can share their object files across the entire network without having to worry about what type of machine they happen to be using at the moment.

Any machine on the network can be used as a development station to generate code for a 68000 based application. Here's an example:

I hope this letter has given you enough information to decide whether our release will interest your readers. If you have any questions about CrossCode C or its significance to VMS users, please give me a call at 1-312-971-8170 and I'll gladly give you more information.

I've enclosed two black-and-white photos, but if you prefer a color photo I'll send you one. One enclosed photo is in landscape orientation, and the other is a portrait. If you plan to print the press release, please consider that your readers may want to see a picture of the product.

Thank you for your time and attention.

Sincerely,

David F. Ziffer
David F. Ziffer, Vice President

ROMable 68000 C Compiler Now Available Under VAX VMS

Eight months after introducing its CrossCode C compiler under MS-DOS and UNIX, Software Development Systems, Inc. (SDSI) has announced that the compiler is now being made available under VAX VMS. CrossCode C is an optimizing C compiler that generates ROMable code for all 68000 family members, including the high-end 68020 and 68030 processors, the 68881 and 68882 floating point coprocessors, and the 68851 MMU. Users may write source code in any combination of C and assembly language, compile the code into object files, and then link the object files to form a complete load for any 68000 family processor.

SDSI found that many of the companies using VMS for embedded systems development were also using MS-DOS and UNIX based machines. Because of this, SDSI designed CrossCode C to run identically and to share source and object files across all three operating systems. For example, the CrossCode C linker on the VAX can link object files that were generated by the CrossCode C compiler under MS-DOS. This feature allows users to move their source code, object files and libraries from machine to machine without making any changes at all.

CrossCode C comes with a Motorola-compatible macro assembler, a linker, a librarian, and a C library containing the source to over 47 C functions. Also included is a universal downloader that communicates with EPROM programmer emulators and target hardware. The downloader converts users' compiled C code into Motorola S-Records and a variety of other industry standard file formats. It also emits symbolic information to provide symbolic debugging capabilities on many popular emulators, including those made by Applied Microsystems, Atron, Huntsville Microsystems, MicroCASE, Northwest Instruments, Orion Instruments, Softaid, Sophia, and ZAX.

CrossCode C runs on all members of the VAX family, including the MicroVAX 2000, MicroVAX II, MicroVAX 3500/3600, VAX 730 and 780, VAX 6200, and VAX 8000 Series machines. Prices start at \$1,595 on the MicroVAX 2000.

SOFTWARE DEVELOPMENT SYSTEMS, INC. was formed in 1984 to provide cross development software to people who build ROMable applications. Since then SDSI has provided cross compilers and cross assemblers to many hundreds of companies and their consultants. Software Development Systems, Inc. is dedicated entirely to the design, manufacture, and support of cross development software.

The PC-68K1 PC Co-Processor

Personal Computers Become Computer Systems

Why?

The standardized, widely accepted, and ubiquitous IBM Personal Computer represents an enormous, yet largely untapped, resource of computing power. Unless connected to a costly LAN and fileserver, the single-user "PC" provides neither the level of interaction nor the convenient sharing of data so necessary in business, science, or industry. However, the simple addition of a PC-68K1 expands and enhances a PC into a real-time, multi-user, multi-tasking, professional computer system, running OS-9 and MS-DOS concurrently. A PC-68K1/OS-9 equipped PC can host a wide variety of high performance application software, previously reserved for much larger and far more expensive machines, without sacrificing MS-DOS applications. The OS-9 operating system offers extensive networking capability and a range of popular languages, including C, BASIC, PASCAL, FORTRAN, etc. Powerful C language VAX/UNIX extensions and a special set of OS-9/UNIX library routines make converting UNIX applications to the more efficient OS-9 a simple and straightforward task.

How?

All that is required to get on-line is an operating PC, a PC-68K1 and OS-9. The PC-68K1 allows the user to flip between active MS-DOS and OS-9 tasks, using the Personal Computer monitor, keyboard, and existing disk drives. MS-DOS files are available to OS-9 and vice versa.

The MEMIOX Memory/IO Expansion Board

Expand Your PC to 14 Ports and 2 Megs RAM

Why?

Anyone who has discovered the capability of real-time, multi-user, multi-tasking OS-9 and the power of the PC-68K1 co-processor knows that adding 10 more efficient serial ports and another megabyte of 0 wait state RAM to a PC-68K1 will turn a "PC" into a substantial computer system. Such a system can run a business, control a plant, automate a laboratory, or support an entire class, and the price is right!

How?

The MEMIOX board plugs onto the PC-68K1 and it is ready to go. For standard installations, there are no jumpers or switches to set. The convenient RJ45 port connectors are mounted right on the MEMIOX board set, so there is no clumsy hardware to attach and connecting peripherals could not be easier. Ultrascience offers a complete line of shielded RJ45 modular cable and adapters to make cabling a snap.

88OPEN CONSORTIUM PROMOTES OPEN STANDARDS FOR MOTOROLA 88000 RISC MICROPROCESSOR; DEMONSTRATES "NEW WAY OF DOING BUSINESS"

The 88open Consortium is a group of leading hardware and software vendors, formally chartered in April 1988 to establish and promote the industry-wide adoption of open standards for products using the Motorola 88000 RISC (Reduced Instruction Set Computing) microprocessor architecture. The members of 88open are leading the way to a new way of doing business in the computer industry — demonstrating that vendors who compete vigorously against one another in the marketplace can benefit from dedicating resources to a cooperative effort to achieve mutual success.

The 88open Mission

The mission of the 88open Consortium reflects the common belief of its membership that the Motorola 88000 microprocessor RISC architecture offers a superior platform for the development of computer systems and software. The timely implementation of standards for hardware and software interfaces to the 88000, prior to the development of a substantial body of systems and software, will achieve clear benefits for both vendors and users of 88000-based products.

The existence of standards will reduce the complexity and cost of developing operating systems, compilers, applications software, and peripheral hardware. Moreover, having invested once in designing for a standard environment, vendors can then invest more of their development resources in improving and differentiating their products. The elaborate porting activities typically needed to move software from one vendor's system to another's will be virtually eliminated. The resulting cost savings will benefit vendors and users alike.

88open welcomes participation in its standards-setting activities from all interested parties, including the academic and user communities. All standards developed by the Consortium will be shared openly and equally. 88open members will automatically receive copies of standards-related documents, and non-members may receive them for a nominal fee.

The members of the Consortium believe product development based on standards will accelerate market acceptance of the 88000 through earlier availability of a broader selection of innovative systems and software at reasonable prices. Customers as well as vendors will be more willing to invest in products based on open standards if they are confident of not being penalized for early commitment to a young technology.

The 88open Charter

The 88open Consortium charter aims to bring about the market success of the 88000 RISC architecture through a variety of programs, beginning with educational and marketing activities to promote the 88000 product family as the most complete and viable RISC processor platform available to the market.

As a part of its mission to develop open standards and encourage their use, the Consortium will participate in standards-setting activities worldwide, wherever appropriate. The Consortium also will speak as a collective voice to influence future development of the 88000 product family.

The Consortium may negotiate with hardware and software vendors to produce 88000-related products for the benefit of 88open members. In addition, members may cooperate to develop products that meet mutual needs, through collaboration between members or through research and development sponsored by the Consortium. It is expected that Consortium members will benefit from more favorable access to such products.

Early Success: The 88000 Binary Compatibility Standard

Only three months after being formally chartered, the Consortium published the *Trial Use Standard* document for the 88000 Binary Compatibility Standard (BCS). The first BCS published for any RISC microprocessor, this standard will allow software written to its specifications to run on any BCS-compliant 88000-based system.

The 88000 BCS is compatible with such widely accepted industry standards as POSIX, X/Open, and the AT&T UNIX System Interface Definition. It supports 90 percent of the specifications developed for the proposed Motorola 68000 BCS, simplifying the portability of applications from one architecture to the other. In addition, the 88000 BCS is implemented at the system call level, and is therefore applicable to any variant of the UNIX operating system or to a non-UNIX operating system.

The 88000 BCS is a subset of the proposed AT&T application binary interface (ABI), a more complete interface standard that will eventually specify extension features such as shared library support, network interface and the "look and feel" of the windowing system. AT&T has indicated informally its intention to use the 88000 BCS as the basis for an 88000 ABI.

The 88open Consortium will work with AT&T to complete the 88000 ABI, and will continue to develop certification tools to verify that application programs conform to the BCS standard.

The 88000 BCS exemplifies the manner in which strategic cooperation among enlightened companies can yield substantive benefits, not only to the direct participants, but also to vendors and customers throughout the industry. There is no doubt that the establishment of this standard so near the introduction of the 88000 architecture will facilitate its rapid acceptance and motivate a variety of developers to exploit its powerful capabilities.

Organization

The Consortium is organized as a not-for-profit member organization. It is governed by a Board of Directors representing member companies, with three directors from hardware vendors, two from software vendors, one from the academic community, one from the membership at large, and one from Motorola.

Day-to-day operations are run by a full-time executive director, who also serves on the Board of Directors. Bob Anundson, formerly of Tektronix, Inc., is executive director. He is assisted by a small staff.

The work of the Consortium is carried on through member volunteer committees. The Technical Committee is charged with proposing and developing definitions, standards and extensions relating to the use of the 88000 architecture and its use in hardware and software; this committee produced the 88000 BCS.

The Business Committee deals with business issues relating to the Consortium, and has broad responsibility for the promotion of the 88000 product family in the marketplace. The World Strategies Committee will focus on the extension of the Consortium's activities and influence worldwide. 88open Consortium offices and staff are planned for Europe and the Pacific Rim.

Corporate members have full voting rights, and thus participate in setting the goals and determining the activities of the Consortium. Non-voting memberships are offered to individuals and non-profit organizations who are interested in the goals of the Consortium.

For more information, contact 88open Consortium, Ltd., 8560 SW Salish Lane, Suite 500, Wilsonville, Oregon 97070; telephone (503) 682-5703.

Language Processors, Inc. Announces Compiler Products for Motorola 88000 RISC Architecture

88open Consortium Task Force Drives Software Development

Framingham, Mass., February 21, 1989 -- Language Processors, Inc. (LPI) today announced software products for the Motorola 88000 RISC architecture and that it has joined the 88open Consortium Ltd. Software Initiative Program. The announcement was made at a news conference held by 88open and attended by more than 15 independent software vendors committed to the 88000 standard. LPI has been a member of the 88open Consortium since June 1988. Since July 21, 1988, Steven W. Weingart, Senior Vice President of Research and Development at LPI, has held a position on the 88open Board of Directors.

Language Processors, Inc. is porting its Family of Compilers to the 88000 RISC architecture. The LPI Family of Compilers includes: BASIC, C, COBOL, FORTRAN, Pascal, PL/I, and RPG II programming languages. Also included is CodeWatch, an interactive, source-level debugger. These products are expected to be released in the second quarter of 1989. The Software Initiative was formed in August 1988 to promote the development of software for the 88000 RISC architecture. The program provides independent software vendors with access to a porting lab, 88000 development hardware, and marketing and technical support from the 88open Consortium. 88open Software Initiative sponsors include Data General, Dolphin Computer, a subsidiary of North Data, Motorola, NCR, Open Systems and Sanyo/Icon International.

"We have been working aggressively with independent software vendors to ensure that applications will be immediately available for 88000-based systems," said Bob Anundson, Executive Director of the 88open Consortium. "The success and momentum of the program is directly related to the growing momentum for the Motorola 88000 architecture."

LPI's compilers and software tools are being developed to be compliant with 88open's Binary Compatibility Standard (BCS). The BCS has been adopted as part of the AT&T Application Binary Interface (ABI). It is expected that BCS compliant software will increase revenues for software developers and provide end users with shrink-wrapped software solutions for all 88000-based hardware systems.

"LPI will be the first language vendors to make available an entire family of integrated software development tools for the Motorola 88000 RISC environment," states Roy A. Finney, President of LPI. "These tools will give the end user the ability to establish proven software applications on the 88000 architecture, as well as develop new ones. This shows LPI's commitment to 88open and our high expectations of the business opportunities associated with Motorola's 88000 RISC microprocessor," he adds.

LPI, a producer of quality software development tools, offers a full suite of 32-bit programming languages, including BASIC, C, COBOL, FORTRAN, PASCAL, PL/I, RPG II, and an interactive source-level debugger, CodeWatch. These software products are presently offered on industry-standard systems such as Motorola's 680X0, WE32000, and Intel's 80386 running UNIX®, XENIX®, and MS-DOS® operating systems.

Headquartered in Framingham, Massachusetts, LPI is a market leader in quality language compilers and software development tools. Since its inception in 1980, LPI's technological advantage has attracted major customers including computer manufacturers, Fortune 500 companies, the federal government, application software developers, and a long list of domestic and international software distributors.

DATA GENERAL UNVEILS FIRST INDUSTRY STANDARD FAMILY OF RISC-BASED SYSTEMS

SAN FRANCISCO, Feb. 28, 1989 -- Data General today unveiled the first members of its new family of products based on the Motorola 88000 architecture. The announcements include: a family of high-performance, VME-based systems that function as servers or multi-user systems for commercial and technical applications; a new family of desktop personal workstations; and DG/UX 4.1, the industry's only version of UNIX supporting a full RISC-based family of systems.

The 88000-based family establishes industry-leading price/performance standards for RISC-based systems. The systems perform at 20 or 40 MIPS or greater and the workstations perform at 17 or 20 MIPS or greater, based on Dhrystone measurements.

"Today's announcement establishes Data General as the industry's leader in cost-effective, distributed computing systems. Data General's experience in building large, well-balanced, high-throughput systems gives our emerging family of 88000-based products a major advantage over similar machines from workstation and PC vendors. This experience has enabled Data General to design machines specifically for the newly emerging styles of computing such as the client/server model," said Herb Geher, division director of product marketing.

"Today we are introducing the first members of a binary-compatible family of products that are faster, less costly and more flexible than any other systems on the market. For the price of today's personal computers, the 88000-based workstation delivers the performance of a mid-range workstation. The 88000-based system is not a headless workstation or a repackaged minicomputer. It is designed with sophisticated I/O and large capacity storage to support a large number of ASCII terminals, networked X-Window graphics terminals and workstations."

The powerful, midrange 88000-based system is available with one or two processors. By swapping the CPU board the user can upgrade from a single to a dual processor, nearly doubling CPU performance. The system is available in desksize and 14-inch-high, MEHA-Standard rackmount versions. Both systems include a ten-slot, industry-standard VME-compatible chassis, up to 208 MB of error-correcting code memory and cartridge and reel-to-reel tape options. The desksize version includes up to 2 gigabytes of mass storage and the rackmount version contains up to 16 gigabytes of mass storage through dual-ported 8-inch SMD disks.

Industry-standard wide and local area communications are provided by synchronous controllers (VSC/4) and the VME bus Ethernet controller (VLC). Up to 312 RS-232 asynchronous connections are handled by terminal services host adapter boards (VDA/128) which connect up to 128 asynchronous devices via cluster controller boxes.

The workstations can support from 4 to 28 MB of memory in a 2-1/2-inch-high pedestal enclosure. The workstations use a single multilayer board containing a Motorola 88100 CPU and FPU, two Motorola 88200 CMUs (Cache and Memory Management Units), and monochrome or color graphics hardware co-processors. Interfaces for a PC/AT keyboard, a three-button optical mouse, a SCSI port, a parallel port, a serial port and 802.3 Ethernet are standard.

The monochrome workstations use the NEC UPD72120 Advanced Graphics Display Controller. The eight-plane color unit, based on a custom graphics coprocessor can display 256 simultaneous colors from a palette of 16.7 million colors. The 20-inch monochrome and 19-inch color flicker-free monitors operate at 70Hz and deliver 1280x1024 pixel resolution.

SCSI peripheral expansion for the diskless workstations is via compact desktop housings. Up to three of these housings can be connected to a workstation. Peripheral options include a 160-MB or 322-MB 5-1/4-inch full-height Winchester disks, a 150-MB quarter-inch cartridge (QIC) tape drive and 5-1/4-inch or 3.5-inch floppy drive.

DG/UX 4.1 is an enhanced version of Data General's commercial-grade DG/UX 4.0 UNIX operating system and is designed to take full advantage of the Motorola 88000 RISC architecture. DG/UX 4.1 incorporates the major features found in UNIX systems with today's dominant UNIX standards.

"DG/UX 4.1, Data General's UNIX operating system with advanced symmetric multiprocessing, enables the 88000-based system to deliver cost-effective computing and modular growth while protecting investments in application software and peripherals," said Osher. "DG/UX 4.1 conforms to the 88open Binary Compatibility Standard allowing customers to run all RISC-compliant software developed on 88000-based systems from any vendor. Application developers can use Data General's DG/UX 4.1 on all these systems to produce shrink-wrapped software for the entire 88000 marketplace."

GIMIX® Sales, Service and Support

11 Feb 1989

Dear Don,

Just two typos to report in the February 'Logically Speaking' - both mine.

Page 19, 6th line up from bottom - should read "making"

Page 22, para 6, line 3, should read "internal-01 doesn't consistently line up ...", NOT "internal-23"

Now that I've got just over 2 years of programming in 68000 Assembler under my belt, I can see what a terrible price we have to pay by writing in position-independent code. I feel that programs such as my RBASIC would execute at least 2 to 3 times as fast if there were only a special version of SK*DOS dedicated to the single end-user (no multi-tasking or multi-user stuff in the works), something like the old 6809 FLEX. With RAMDISK at the top of memory, and a fixed Load-Address for applications programs, we could really blast along!

The Load-Address could be set high enough (say \$10000) to allow for future improvements to SK*DOS. Ah, if only this could be so ... I'd gladly take the time to re-write RBASIC for such a set-up, and still keep up with the present version to run under a future multi-whatsit SK*DOS!! How about it, Pete? (Stark, that is)

Maybe readers who program in 68000 Assembler would be interested in learning of the many snags which lie in wait for the unwary, and some of the procedures I've evolved to make a programmer's life a little easier! Let me know!!

Don Williams,
68 Micro Journal,
5900 Cassandra Smith Road,
Bixson, TN 37343

Sincerely,

Bob

R. Jones
President

DG/UX 4.1 is a full POSIX implementation, compatible with System V Interface Definition Issue 2 (SVID2) and Berkeley Software Distribution (BSD) 4.2. DG/UX offers the benefits of any standard UNIX system while providing unique, application-transparent capabilities such as fully symmetric multiprocessing support; a robust, flexible file system; an enhanced scheduler and extended error reporting. It also supports TCP/IP communications software, NFS 4.0 and X-Window Version 11 Release 3.

DG/UX 4.1 fully implements the 88open Binary Compatibility Standard. "As a founding member of 88open Data General has actively participated in the 88open Software Initiative program designed to supply software for 88000-based systems," added Osher. The 88open is a non-profit consortium of companies that manufacture, develop, sell or use products based on Motorola's 88000 RISC architecture.

CROSS ASSEMBLERS

The CSC Cross Assemblers are actually a set of table-driven assemblers for several different microprocessors, currently including 1802/5, 6800/1/11/6303, 6804, 6805, 6809, 6502/3/65C02, 8080/5, 8048, 8051, Z-8, Z-80, with others being added occasionally. Separate 68010 and 32000 cross-assemblers are also available for the same price. A macro pre-processor is included with any purchase of cross-assemblers.

In addition to the basic ability to recognize the target computer's assembly language and to process symbolic address expressions, the cross-assemblers have the ability to support structured assembly programming, the ability to define conditional assembly directive expressions, and the ability to assemble programs stored in modular form.

Since the Motorola 6801 instruction set forms a superset of the 6800, 6802, and 6808 instruction sets, and is the same as the 6803 instruction set, the CSC 6801 Assembler is also capable of assembling programs written for all of those microprocessors.

The CSC 6801 Assembler is also capable of assembling programs for the Hitachi 6303, as it recognizes the six extra instructions, and for the Motorola 68HC11, as it recognizes the extra instructions and addressing modes.

The CSC 6809 assembler also recognizes 6800 and 6801 mnemonics, generating code for them to closely simulate the register and memory changes caused by the instructions on the 6800 and 6801.

The CSC 6805 Assembler is also capable of assembling programs written for the Motorola 146805 and 68HC05, as it recognizes the extra instructions implemented by those processors.

CSC also offers simulators to assist in the debugging of object programs destined for 6800/1, 6805, 6809, 6502, and Z-80 systems, on selected host systems only.

The cross-assemblers, with printed manuals, binary utilities, and macro pre-processor, are available for a retail price of \$50 each \$100 for three, or all for \$200. The C sources are available for an additional \$50 each, \$100 for three, or \$300 for all. The programs may be ordered from the following address:

Dear Don,

I have been using Introl C, version 1.5, for about three years on my OS-9 (tm Microware) Level 2 system (6809), and am quite pleased with it. It seems more bug-free than some of the MS-DOS C compilers. A few years ago, Dr. Dobb's Journal pointed out several bugs in various C compilers for MS-DOS. I tried all of these tests on the Introl C compiler and found that it has none of these bugs. I have, however, found one bug and a "problem" in the Introl compiler.

The bug occurs when a character (type "char") variable or expression is used as a subscript. In Listing 1, "tabl" is an array of structures, and the character variable "x" is used as a subscript. For the last line of the listing, the code generated by the compiler multiplies the subscript "x" by the size of the structure (10 bytes) to get the offset of the desired element of the array. In this example, the result will be 260 (decimal) or 0104 (hex). The high-order byte of this offset is then cleared (apparently because it is a "character" value!), resulting in 0004 (hex), or simply 4. The offset is then added to the address of the start of the array in order to point at the desired element of the array. The result is four bytes from the start of the array, and not 260 as it should be. Similar behavior will occur if an "int" (integer) array is subscripted with a character variable or expression whose value is 128 or more. This bug can be gotten around by using an "int" as the subscript or by using a cast, such as:

```
val = tabl[(int) x].a;
```

The "problem" mentioned in the first paragraph can be illustrated by considering the program "sample.c" (listing 2). To compile

and link this program, one uses the commands:

```
icc sample  
ilink sample
```

This results in an executable module called "sample", on the same disk as the source file. In my system, this is usually disk "/d1". I usually "load" a program first before running it, as follows:

```
load /d1/sample  
sample
```

And now for the problem. When "sample" is run (the last line above), an access to the system disk is made before any output from "sample" occurs. After some investigation, I discovered what is happening.

When "sample", or any C program, is run, it starts in a "start-up" routine. This start-up routine does some initialization and set up, before calling "main". One of the functions of this initialization is to put in initial values for external data, which is all variables declared outside of all C functions. External variables which were declared with initial values will have those values inserted at this time. All other external variables will be set to 0 (zero).

In order to set up the declared initial values, the start-up code looks for a module whose name is the same as that of the executable module, with the characters ".DAT" added at the end. For this example, it would look for a module named "sample.DAT". This module, if it exists, is assumed to contain a table of initial values and where in the data area to put them.

First, the "link" system call is used, to see if the module is already in memory. If this call fails, the "load" system call is used, to look for the module in the commands directory. This is the disk access which I would like to avoid. If the "load"

fails, too, then plugging initial values is skipped. Then "main" is called, which in this case prints a message.

This scheme works fine for programs that declare one or more initial values. In this case, the module sample.DAT (or whatever the name happens to be) is part of the executable file "sample". That is, if "sample.c" had contained one or more variables with an initial value, the file "sample" would contain an executable module called "sample" followed by the data module "sample.DAT". The "link" system call in the start-up code would succeed and no extraneous disk access occurs.

In the example, however, no initial values are given and the module "sample.DAT" is NOT part of the file "sample". In fact, "sample.DAT" is not created anywhere.

An easy "fix" would be to declare an initial value for some (external) variable. However, I preferred a solution that did not require an extra module, so I came up with the solution in Listing 3. The added function "fixload" patches the startup code to skip the attempt to load the module from the commands directory. It does this by looking at the function "cprep", the function in the Introl library that looks for the data module. The first two tests in "fixload" check to see if the module has already been patched. The rest of the tests verify that the code being patched is really the intended code. If all of the tests succeed, a branch instruction is inserted. This branches around the attempt to "load" the data module.

With this fix, the program still looks for the module "sample.DAT" on disk the first time it is run, since the startup code is executed before "main" is called. After that, as long as the in-memory copy of the program is run, the extraneous disk access does not occur. To make the change more permanent, SAVE the

program (after running it at least once) and use **VERIFY** to correct the CRC. Then use **ATTR** on the corrected module to make it executable.

Note that the values used in "fixload" apply to the particular version of the Introl C Compiler that I have, and may or may not be correct for other versions.

The solution I have described is adequate for my use, but it requires the addition of code (the function "fixload") to most of the C programs that I write for OS-9. A more elegant solution would be to write a separate program that patches the disk copy of the module directly (and updates the CRC).

```
/*
  Listing 1
  Shows bug in Version 1.5
  of Introl C Compiler.
*/
```

```
struct {
  int a;
  int b;
  int c;
  int d;
  int e;
} tabl[30];
```

```
main() {
  int val;
  char x;

  x = 26;
  val = tabl[x].a;
}
```

The compiler generates the following assembly output. The "clra" instruction should not be there.

```
_tabl comm      300
      loc      0
_main: leas     -3,s
      ldb      #26
      stb      2,s
      lda      #10
      mul
      clra
      leax     _tabl,y
      ldd      d,x
      std      0,s
      leas     3,s
      rts
      end
```

Listing 2

```
/*      sample.c      06/09/88      */

main() {
  printf("This is a sample program\n");
}
```

TRANSLATE 6809 TO 68020

**A service to provide a raw translation of
6809 assembler to 68000 or 68020**

- Cut 50% or more off hand translation time
- Converts to 68000 or 68020 assembler
- Old code may be included in comments
- Special conversion of *psh* and *pul* to *movem*
- All 6809 addressing modes supported
- Choice of register assignments and sizes
- Upper to lower case conversion included
- In-line warnings for likely problems

Don't pitch It - translate It

DISK AND BASIC UTILITY PROGRAM LIBRARY

\$50-FLEX \$30-UNIX/MSDOS

Hide disk sectors, sort directory, maintain master catalog, do disk scans, resequence sectors or all BASIC programs, and BASIC programs, etc. non-FLEX versions include sort and resequence only

PROFESSIONAL SERVICES FOR THE COMPUTING COMMUNITY

CUSTOMIZED PROGRAMMING

We will customize any of the programs described in this advertisement or in our brochure for specialized customer use or to cover new processors; the charge for such customization depends upon the marketability of the modifications.

CONTRACT PROGRAMMING

We will create new programs or modify existing programs on a contract basis, a service we have provided for over twenty years; the companies on which we have performed contract programming include most popular models of mainframes, including IBM, Burroughs, Univac, Honeywell, most popular models of minicomputers, including DEC, IBM, DG, HP, AT&T, and most popular brands of microcomputers, including 6800/1, 6809, Z80, 6502, 68010, using most appropriate languages and operating systems, on systems ranging in size from large telecommunications to single board controllers; the charge for contract programming is usually by the hour or by the task.

CONSULTING

We offer a wide range of business and technical consulting services, including systems advice, training, and design, on any topic related to computers; the charge for consulting is normally based upon time, travel, and expenses.

ATARI & AMIGA CALL

As most of you know, we are very sensitive to your wishes, as concerns the contents of these pages. One of the things that many of you have repeatedly written or called about is coverage for the Atari & Amiga™ series of 68000 computers.

Actually we haven't been too keen on those systems due to a lack of serious software. They were mainly expensive "game-toy" systems. However, recently we are seeing more and more honest-to-goodness serious software for the Atari & Amiga machines. That makes a difference. I feel that we are ready to start some serious looking into a section for the Atari & Amiga computers. Especially so since OS-9 is now running on the Atari (review copy on the way for evaluation and report to you) and rumored for the Amiga. Many of you are doing all kinds of interesting things on these systems. By sharing we all benefit.

This I must stress - Input from you on the Atari & Amiga. As most of you are aware, we are a "contributor supported" magazine. That means that YOU have to do your part. Which is the way it has been for over 10 years. We need articles, technical, reviews of hardware and software, programming (all languages) and the many other facets of support that we have pursued for these many years. Also I will need several to volunteer to do regular columns on the Atari & Amiga systems. Without constant input we can't make it fly! So, if you do your part, we certainly will do ours. How about it, drop me a line or give me a phone call and I will get additional information right back to you. We need your input and support if this is to succeed!

THE 6800-6809 BOOKS

..HEAR YE.....HEAR

OS-9™ User Notes

By: Peter Dibble

The publishers of 68' Micro Journal are proud to make available the publication of Peter Dibble's **OS9 USER NOTES**

Information for the **BEGINNER** to the **PRO**,
Regular or CoCo OS9

Using OS9

HELP, HINTS, PROBLEMS, REVIEWS, SUGGESTIONS, COMPLAINTS,
OS9 STANDARDS, Generating a New Bootstrap, Building a
new System Disk, OS9 Users Group, etc.

Program interfacing to OS9

DEVICE DESCRIPTORS, DIRECTORIES, "FORKS", PROTECTION,
"SUSPEND STATE", "PIPES", "INPUT/OUTPUT SYSTEM", etc.

Programming Languages

Assembly Language Programs and interfacing; Basic09, C,
Pascal, and Cobol reviews, programs, and uses; etc.

Disks Include

No typing all the Source Listings in. Source Code and,
where applicable, assembled or compiled Operating
Programs. The Source and the Discussions in the
Columns can be used "as is", or as a "Starting Point"
for developing your OWN more powerful Programs.
Programs sometimes use multiple Languages such as a
short Assembly Language Routine for reading a
Directory, which is then "piped" to a Basic09 Routine
for output formatting, etc.

BOOK \$9.95

FLEX™ USER NOTES

By: Ronald Anderson

The publishers of 68 MICRO JOURNAL are proud to make available the publication of Ron Anderson's **FLEX USER NOTES**, in book form. This popular monthly column has been a regular feature in 68' MICRO JOURNAL SINCE 1979. It has earned the respect of thousands of 68 MICRO JOURNAL readers over the years. In fact, Ron's column has been described as the 'Bible' for 68XX users, by some of the world's leading microprocessor professionals. The most needed and popular 68XX book available. Over the years Ron's column has been one of the most popular in 68 MICRO JOURNAL. And of course 68 MICRO JOURNAL is the most popular 68XX magazine published.

Listed below are a few of the **TEXT** files included in the book and on diskette.

All TEXT files in the book are on the disks

LOGOC1	File load program to offset memory — ASM PIC
MEMOVE C1	Memory move program — ASM PIC
DUMP C1	Printer dump program — uses LOGO — ASM PIC
SUBTEST C1	Simulation of 6800 code to 6809, show differences — ASM
TERMEM C2	Modem input to disk (or other port input to disk) — ASM
MC2	Output a file to modem (or another port) — ASM
PRINT C3	Parallel (enhanced) printer driver — ASM
MODEMC2	TTL output to CRT and modem (or other port) — ASM
SCIPKG C1	Scientific math routines — PASCAL
UC4	Mini-monitor, disk resident, many useful functions — ASM
PRINT C4	Parallel printer driver, without PFLAG — ASM
SETC5	Set printer modes — ASM
SETBAS1 C5	Set printer modes — A-BASIC

NOTE: .C1, .C2, etc. = Chapter 1, Chapter 2, etc.

**Over 30 TEXT files included is ASM (assembler)-PASCAL-
PIC (position independent code) TSC BASIC-C, etc.

Book only: **\$7.95** + \$2.50 S/H

With disk: 5" **\$20.90** + \$2.50 S/H

With disk: 8" **\$22.90** + \$2.50 S/H

K-BASIC™

The Only 6809 BASIC to Binary Compiler for OS-9
FLEX or SK*DOS

Even runs on the 68XXX SK*DOS Systems*

*Hundreds Sold at
Suggested Retail:*

~~\$199.00~~

• 6809 - OS-9™ users can now transfer their FLEX™ Extended BASIC (XBASIC) source files to OS-9, compile with the OS-9 version and run them as any other OS-9 binary "CMD" program. Much faster than BASIC programs.

• 6809 - FLEX users can compile their BASIC source files to a regular FLEX ".CMD" file. Much faster execution.

• 68XXX - SK*DOS™ users running on 68XXX systems (such as the Mustang-08/A) can continue to execute their 6809 FLEX BASIC and compiled programs while getting things ported over to the 68XXX. SK*DOS allows 6809 programs to run in emulation mode. This is the only system we know of that will run both 6809 & 68XXX binary files.

K-BASIC is a true compiler. Compiling BASIC 6809 programs to binary command type programs. The savings in RAM needed and the increased speed of binary execution makes this a must for the serious user. And the price is now RIGHT!

Don't get caught up in the "Learn a New Language" syndrome - Write Your Program in BASIC, Debug it in BASIC and Then Compile it to a .CMD Binary File.

PT-68000 SINGLE BOARD COMPUTER

The PT68K2 is Available in a Variety of Formats
From Basic Kits to Completely Assembled Systems

BASIC KIT (8 MHZ) - Board, 68000,
HUMBUG MONITOR + BASIC in ROM,
4K STATIC RAM, 2 SERIAL PORTS, all
Components **\$200**

PACKAGE DEAL - Complete Kit with
Board 68000 10 MHZ, SK-DOS, 512K
RAM, and all Necessary Parts **\$575**

ASSEMBLED BOARD (12 MHZ)
Completely Tested, 1024K RAM,
FLOPPY CONTROLLER, PIA, SK-DOS
\$899

ASSEMBLED SYSTEM - 10 MHZ
BOARD, CABINET POWER SUPPLY,
MONITOR + KEYBOARD, 80 TRACK
FLOPPY DRIVE, CABLES **\$1299**
For A 20 MEG DRIVE, CONTROLLER
and CABLES **Add \$295**

PROFESSIONAL OS9 \$500

FEATURES

- MC68000 Processor, 8 MHZ Clock (optional 10, 12.5 MHZ)
- 512K or 1024K of DRAM (no wait states)
- 4K of SPAM (6116)
- 32K, 64K or 128K of EPROM
- Four RS-232 Serial Ports
- Floppy disk controller will control up to four 5 1/4", 40 or 80 track.
- Clock with on-board battery.
- 2 - 8 bit Parallel Ports
- Board can be mounted in an IBM type PC/XT cabinet and has a power connector to match the IBM type power supply.
- Expansion ports - 6 IBM PC/XT compatible I/O ports. The HUMBUG monitor supports monochrome and/or color adaptor cards and Western Digital winchester interface cards.

An Ace of a System in Spades! The New

MUSTANG-08/A™

Now with 4 serial ports standard & speed increase to 12 Mhz CPU + on board battery backup and includes the PROFESSIONAL OS-9 package - including the \$500.00 OS-9 C compiler! This offer won't last forever!

NOT 128K, NOT 512K FULL 768K No Wait RAM

The MUSTANG-08™ system took every hand from all other 68008 systems we tested, running OS-9 68K!

The MUSTANG-08 includes OS-9 68K™ and/or Peter Starke SKDOS™. SKDOS is a single user, single tasking system that takes up where FLEX™ left off. SKDOS is actually a 68XXX FLEX type system (Not a TSC product.)

The OS-9 68K system is a full blown multi-user, multi-tasking 68XXX system. All the popular 68000 OS-9 software runs. It is a speed whiz on disk I/O. Fact is the MUSTANG-08 is faster on disk access than some other 68XXX systems are on memory cache access. Now, that is fast! And that is just a small part of the story! See benchmarks!

System Includes OS-9 68K or SKDOS - Your Choice Specifications:

CPU	MC68008	12 Mhz
RAM	768K	256K Chips
	No Wait States	
PORTS	4 - RS232	MC88B1 QUART
	2 - 8 bit Parallel	MC8821 PIA
CLOCK	MC48T02	Real Time Clock Bat. B/U
EPROM	16K, 32K or 64K	Selectable
FLOPPY	WD1772	5 1/4 Drives
HARD DISK	Interface Port	WD1002 Board

Now more serial ports - faster CPU
Battery B/U - and \$850.00 OS-9 Profes-
sional with C compiler included!

*\$400.00

See Mustang-02 Ad - page 5
for trade-in details

Hard Disk System

\$2,398.90

Complete with PROFESSIONAL OS-9
includes the \$500.00 C compiler, PC
style cabinet, heavy duty power supply,
5" DDDS 80 track floppy, 25 MegByte
Hard Disk - Ready to Run

Unlike other 68008 systems there are several significant differences. The MUSTANG-08 is a full 12 Megahertz system. The RAM uses NO wait states, this means full bore MUSTANG type performance.

Also, allowing for addressable ROM/PROM the RAM is the maximum allowed for a 68008. The 68008 can only address a total of 1 Megabytes of RAM. The design allows all the RAM space (for all practical purposes) to be utilized. What is not available to the user is required and reserved for the system.

A RAM disk of 480K can be easily configured, leaving 288K free for program/system RAM space. The RAM DISK can be configured to any size your application requires (system must have 128K in addition to its other requirements). Leaving the remainder of the original 768K for program use. Sufficient source included (drivers, etc.)
